Butane-1,4-diol and its derivatives containing two hydroxyl groups. I. G. Farbenindustrie A.-G. Brit. 508,944, June 26, 1939. Acetylene glycols of formula $R^1R^2C(OH)C{:}CC(OH)R^3R^4$, where R^1, R^2, R^3 and R^4 are H or identical or different alkyl, cycloalkyl, aralkyl or aryl groups or heterocyclic radicals, are converted into the corresponding satd. glycols by hydrogenation. In examples, butyne-1,4-diol and 1,1,4,4-tetramethyl-2-butynediol are hydrogenated in the presence of Ni catalysts.

Ketene and its homologs. Karl T. Steik (to Standard Oil Development Co.). U. S. 2,184,963, Dec. 26. In the manuf. of ketene and its homologs by pyrolysis of compds. such as acetone in contact with Cu at about 750°, the hot gaseous products of pyrolysis including ketene issuing from the pyrolysis zone are rapidly and immediately brought into contact with a liquid cooling medium such as acetone under conditions adapted to cool the gaseous products rapidly to a temp. below that at which the ketene present tends substantially to decompose or polymerize.

Xanthene. A. A. Vansheidt and T. N. Erlykov. Russ. 55,968, Oct. 31, 1939. A mixt. of phenol and formaldehyde in the ratio of 10:1 is heated above 175° under pressure in the presence of HCl as catalyst; unchanged

phenol is distd. off *in vacuo*, while the xanthene is distd. off with steam.

6-Ethoxyquinaldine. A. N. Iordanskiĭ. Russ. 52,-327, Dec. 31, 1937. To *p*-phenetidine is added 20% HCl and the mixt. is heated with AcH.

Refining benzanthrone. A. O. Orzhekhovskiĭ. Russ. 56,124, Nov. 30, 1939. Benzanthrone is recrystd. from org. water-immiscible solvents in the presence of small amts. of inorganic acid or base.

Preparing 2-methyl-5-chloromethyl-6-aminopyrimidine hydrochloride. Gustav A. Stein (to Research Corp.). U. S. 2,184,964, Dec. 26. A soln. of 2-methyl-5-ethoxymethyl-6-aminopyrimidine in a lower aliphatic alc. such as BuOH is treated with HCl (suitably on a steam bath, by passing in dry HCl).

Purifying isoviolanthrone. L. G. Krolik. Russ. 56,-094, Nov. 30, 1939. Isoviolanthrone is treated with 15–20 vols. of a 92–3% H_2SO_4 at 40°, kept at this temp. for 4–5 hrs., filtered, and washed first with H_2SO_4, and then with water to complete removal of the H_2SO_4.

A—GENERAL

ARTHUR W. DOX

Catalysts, catalyst-modifiers, life and the specificity of vital processes. Jerome Alexander. *Biodynamica* No. 54, 32 pp.(1939).—The physicochem. mechanism of catalysis is understandable as consequent upon the effects of highly specific residual electronic fields on particles which enter the electronic jurisdiction of the catalyst in proper presentation and remain long enough to be united or broken up. Specific substances which enter the catalyst surface and alter the specificity of the surface and of the catalyst, are termed "modifiers." The simplest living units appear as self-reproducing (autocatalytic) catalyst particles, endowed with 2 essential functions: self-duplication and the catalytic direction of chem. change. The orderly course of life and of differentiation in a developing zygote may be understood as based on the activity of specific catalysts, modified at definite stages by specific modifiers. A mechanism is suggested whereby modifiers present in the zygote cytoplasm may serve as templets to reproduce their like. Abnormalities of structure and function may result from abnormal modifiers; thus methylcholanthrene which leads to cancerous growth, may be regarded as a modifier of this type. The concept of cytoplasmic modifiers opens the door to an understanding of cytoplasmic inheritance and of the slight differences in identical twins. It also discloses a mechanism whereby acquired characteristics might be inherited, and evolutionary changes, apart from gene mutations and chromosomal anomalies, might occur. Substances considered as secondary constituents or "negligible impurities" may serve as prosthetic groups or as "carriers" in catalysts, or as "cohesive colloids," exerting a potent influence on structure and function, e. g., in tissue formation, diffusion, filtration, etc. Assembly in a crystal space lattice being a potential min. toward which mols. tend, the crystn. of some living units is not surprising. Apart from gross crystn., proteins show sp. aggregative tendencies. At a certain stage of particulate organization we must envisage the possibility of particulate unions and dissocns. which are not understandable in terms of simple stoichiometry. Jerome Alexander

Denaturation and molecular splitting of ovalbumin by ultraviolet radiant energy. F. W. Bernhart. *J. Biol. Chem.* 128, 289–95(1939).—Irradiation of aq. ovalbumin at 25° by Hg arc causes the formation of secondary protein derivs. which can be dialyzed at pH 4.8. The wts. of ovalbumin pptd. at the isoelec. point after irradiation indicate that the formation of denatured protein and of sol. protein derivs. from the denatured protein are first-order processes. O does not influence the denaturation process but increases the formation of sol. protein derivs. B. C. P. A.

Symplexes of proteins with other tissue components. St. J. Przyłecki. *Roczniki Chem.* 18, 743–6(1938); cf. *C. A.* 33, 3823⁶.—Types of symplexes are classified. B. C. P. A.

***β-h*-Fructosidase.** IV. R. Weidenhagen and L. Nenninger. *Z. Wirtschaftsgruppe Zuckerind.* 89, Tech. Tl., 149–70(1938); cf. *C. A.* 31, 2244⁵.—The dialyzates of the elutions of the product obtained by treating slightly acid yeast autolyzates with $Sr(OH)_2$ contain a chromoprotein (cytochrome?) which is pptd. by suitable addn. of AcOH. The activity of the soln. is almost unchanged and small amts. of another pigment are readily removed by active $Al(OH)_3$. Further purification of *β-h*-fructosidase [invertase] cannot be effected by treating the dialyzate with $Sr(OH)_2$, but, under defined conditions, good results are obtained by pptn. with uranyl acetate and elution with $(NH_4)_2HPO_4$. The use of aged autolyzates offers no advantage. If the temp. is kept below 7°, further purification of the invertase can be effected by addn. of MeOH to the soln. whereby the ppt. retains the whole of the activity. As the temp. is raised there is more pronounced inactivation and loss of soly. in water until at about 37° complete inactivation and insolubility are attained. EtOH can replace MeOH and can be used with large quantities of enzyme. Inactivation by alc. probably depends on a reversal of the change, coenzyme + apoenzyme → holoenzyme, and denaturation of the protein carrier (dehydration?) in such a manner that it is no longer able to unite with the coenzyme. The purest prepns. obtained by the authors still contain a polysaccharide which gives mannose when hydrolyzed with H_2SO_4 or HCl; it is uncertain whether this is due to yeast gum which accompanies the enzyme. B. C. P. A.

Action of colored light on the growth of young homeotherms (phototropism). M. Baccino. *Ann. physiol. physicochim. biol.* 15, 785–9(1939).—The growth of young rabbits, guinea pigs, white rats and kittens was retarded by light that had passed through blue, yellow or green cellophane screens (neg. tropism), but was definitely stimulated by light from red or violet screens (pos. tropism), probably because of the effect on the tropism and the various mechanisms comprising the cellular metabolism. The intermediary processes leading to this retardation or stimulation may be governed by a physicochem. humoral mechanism, a nervous mechanism or a combination of both. Ruth Berggren

An aspect of intercellular electric transmission: the synaptic delay. A. M. Monnier and G. Coppée. *Ann. physiol. physicochim. biol.* 15, 890–6(1939).—An important synaptic delay is not an index of a chem. transmission, especially when the post-synaptic element tends to become rhythmical. This delay would then result from the periodic character of the processes of elec. excitation produced by the potential of presynaptic action. Ruth Berggren

Action of heat on hemoglobin and reversible stages of protein coagulation. Jean Roche and Mohamed-Salah Chouaïech. *Compt. rend.* 209, 1017–19(1939); cf. *C. A.* 32, 2149⁸, 2150⁷, 6302⁹.—Reversed beef hemoglobin (Hb) was prepd. by coagulating Hb at 90°, treating with faintly alk. KCN (cf. Anson and Mirsky, *C. A.* 24, 1399; 25, 308, 4899), reducing and dialyzing the soln. and then shaking with O. The reversed Hb was not identical with the native Hb. Both showed the same spectrum characteristics, but the reversed Hb was less resistant to alkalies, and its mols. in dil. solns. were smaller. The mol. wt. (detd. osmometrically) of the native Hb was 68,000; that of the reversed Hb was about 33,000 in very dil. solns., but increased progressively up to 68,000 with increase in the protein concn. The spectrum characteristics

of Hb are not an abs. index of the integrity of the mol., nor can the speed of cleavage in 0.05 *M* NaOH characterize in itself a native Hb. The cohesive forces between the 4 mol. units in the native Hb are changed reversibly under certain conditions, while the affinity of the globin for the hematin diminishes during coagulation by heat. Ruth Berggren

The inhibitory effect of the serum proteins on the alteration of bilirubin in alkaline solution. Augustin Boutaric and Madeleine Roy. *Compt. rend.* **209**, 1021–3(1939).—The optical d. of 0.01% bilirubin in soln. A (0.8% NaCl; Na = 0.01 *M*) diminished rapidly upon dilu. with an equal vol. of soln. A but remained const. for 11 days upon dilu. with an equal vol. of horse serum. The bilirubin soln. remained essentially unchanged for 24–48 hrs. upon the addn. of serum in the proportion of 1–2 cc. per 25 cc. In buffered solns. (pH 6.85–7.20) contg. 1, 5 and 10 mg. bilirubin and 0.2, 1 and 2 g. serum albumin per 100 cc., resp., the oxidation of the bilirubin was arrested for a practically indefinite period. Ruth Berggren

Enzymic degradation of polyamines. VI. The diamine-diamine oxidase reaction. E. A. Zeller, R. Stern and M. Wenk. *Helv. Chim. Acta* **23**, 3–17(1940)(in German); cf. *C. A.* **34**, 1700[8]. *l*-Ephedrine acts as a competitive inhibitor on diamine oxidase (I); this reaction is, therefore, not sp. for the monoamine oxidase. Only in amts. greatly exceeding those which are pharmacologically active does curare exert its action on I. Amino aldehydes are probably products of the diamine-I reaction. New material has been introduced to show that the cyanide inhibition of I differs from the 2 previously known mechanisms of inactivation of enzymes by cyanides. I is broken down into an apoenzyme and a coenzyme; the latter apparently has a flavin group. The enzymic oxidation of the products of the diamine-I reaction are discussed. Rat liver causes oxidative deamination of β-alanine. Ruth Berggren

The solubility of glycine anhydride. Kurt H. Meyer and O. Klemm. *Helv. Chim. Acta* **23**, 25–7(1940)(in French).—The solubilities of glycine anhydride (diketopiperazine) (I) in 0.25, 0.5, 1, 2 and 3 *M* LiBr, LiI, NaCl, NaBr, NaI, KCl, KBr, KI and KF at 20° are given in tabular form and plotted. In 0.25–1 *M* LiBr, 0.25 *M* NaCl, 0.25 *M* NaBr, 0.25–1 *M* KCl, 0.25–0.50 *M* KBr and 0.25–3 *M* KF the soly. of I was lower than in H_2O (1.43 g. in 100 cc.), while in the remaining solns. it was higher. At low salt concns. electrostatic effects cause pptn., while at higher concns. sol. complexes are formed as the result of sp. forces of attraction between the ions and the characteristic groups. The behavior of certain peptides, as synthetic polyglycines and silk fibroin, is probably similar to that of I. The soln. or marked swelling of some proteins in LiBr, alk. iodides and $Ca(SCN)_2$, as well as the soly. of I and proteins in concd. urea solns., may also be explained on the basis of the formation of sol. complexes. Ruth Berggren

Thermochemical studies on enzyme action. M. Isihama. *Fukuoka Acta Med.* **31**, 150–1(1938). C. L. B.

The effects of certain fat acids on peptic activity. E. Tria. *Atti accad. Lincei, Classe sci. fis., mat. nat.* **29**, 699–701(1939).—By the same technique as in (*C. A.* **32**, 5014[1]), the effects of oleic, stearic and capric acids on the activity of pepsin were measured. All these fat acids retard the action of pepsin, oleic having the greatest retarding effect. A. W. Contieri

Ecological conditions in a brackish lagoon. G. Clifford Carl. *Ecology* **21**, 65–74(1940).—The chlorinity of the water was greater in summer than in winter in Lost Lagoon near Stanley Park, Vancouver, B. C. The amt. of dissolved O_2 was correlated with the amt. of sunlight through the photosynthetic activities of phytoplankton and larger aquatic plants. The total carbonate content varied directly as the chlorinity. They were detected in the normal form in summer only, when the animal component of the plankton was low. The pH was influenced to some extent by the nature of the plankton as well as by the chlorinity and carbonate content of the water. The NH_3 nitrogen content was generally low while the albuminoid N content was high and the increased amts. of nitrogenous matter may have been produced by the decay of the plankton crop. The presence of nitrite was detected only in the winter, possibly because oxidizing processes are slowed down at that time. C. R. Fellers

The effect of phosphate buffers on the electrical mobility of hemoglobin. M. H. Gorin, H. A. Abramson and L. S. Moyer. *J. Am. Chem. Soc.* **62**, 643–4(1940).—The data of Davis and Cohn (cf. *C. A.* **33**, 8080[9]) on the electric mobility of hemoglobin in phosphate buffers are reasonably explained by considering the 2 ways that the elec. mobility of a protein can be affected by variations of the ionic strength of a buffer at const. pH; the 2 effects that must be considered are (1) a change in the ion atm., and (2) a change in the charge of the protein due to sp. interaction with ions of the buffer. A. B. Garrett

Should colchicine be considered a stimulant of cell division? V. Bureau and V. Vilter. *Compt. rend. soc. biol.* **132**, 558–62(1939).—Discussion, with neg. conclusion. L. E. Gilson

Extracellular and intracellular hydrogen-ion concentration in relation to anesthetic effects of barbituric acid derivatives. G. H. A. Clowes, A. K. Keltch and M. E. Krahl. *J. Pharmacol.* **68**, 312–29(1940).—The effects were studied of 30 substituted barbituric acids on the cell division of sea-urchin (*Arbacia punctata*) eggs under various conditions of pH. L. E. Gilson

The role of changes in extracellular and intracellular hydrogen-ion concentration in the action of local anesthetic bases. M. E. Krahl, A. K. Keltch and G. H. A. Clowes. *J. Pharmacol.* **68**, 330–50(1940); cf. *C. A.* **32**, 5421[3].—The relation of pH to the action of cocaine, procaine and 14 other anesthetic bases on sea-urchin (*Arbacia punctata*) eggs and larvae is discussed. L. E. Gilson

The biochemistry of the thyroid gland. C. R. Harington. *Dansk Tids. Farm.* **13**, 285–94(1939). **New chemical investigations on peptides and proteins.** *Ibid.* 294–304. **Researches in synthetic immunochemistry.** *Ibid.* 304–14.—Lectures given before the Danish Pharmaceutical Soc. Otto Johnson

Micelle formation in aqueous solutions of bile salts. Raymond R. Roepke and Harold L. Mason. *J. Biol. Chem.* **133**, 103–8(1940).—Detns. of the osmotic coeff.-concn. and equiv. cond.-concn. curves for Na glycocholate, cholate, glycodesoxycholate and oleate at 25° indicate that the bile salts form ionic micelles above a crit. concn. It is suggested that soln. of water-insol. substances by the bile may be assocd. with micelle formation of the bile salts in a manner similar to the soln. of oils by soap solns. A. P. Lothrop

The action of papain and trypsin on certain dehydrogenases. Frederick Bernheim. *J. Biol. Chem.* **133**, 141–4(1940).—Amine oxidase and *d*-amino acid oxidase are inactivated much more slowly by papain and trypsin than succinoxidase, choline oxidase and the cytochrome-cytochrome oxidase system. The O_2 uptake but not the methylene blue reduction by succinoxidase is inactivated more rapidly by trypsin than papain. The succinoxidase and choline oxidase are inactivated at about the same rate and the cytochrome oxidase system more slowly by the proteinases. The liver and kidney of the rat were used as the source of the dehydrogenases. A. P. Lothrop

The action of fat acids on the choline oxidase of rat liver. Frederick Bernheim. *J. Biol. Chem.* **133**, 291–2(1940); cf. preceding abstr.—0.004 *M* stearic acid in buffer inhibits choline oxidase activity 61%. It seems possible that the concn. of fat acid may det. how much free choline can be oxidized in the liver and how much can be used for the synthesis of phospholipides. Increasing concns. of stearic acid inhibit succinoxidase next and then cytochrome oxidase. Palmitic and oleic acids in equiv. concns. caused 41 and 29% inhibition, resp. The inhibition occurs only below pH 7; this indicates that the undissocd. acid is the active agent. Fats such as olive and cod-liver oils and a mixt. of cephalin and lecithin were without effect. A. P. Lothrop

The occurrence of leucylpeptidase. Julius Berger and Marvin J. Johnson. *J. Biol. Chem.* **133**, 67–72(1940);

cf. *C. A.* **33**, 9334[8].—Leucylpeptidases are present in the proteolytic systems of the human duodenum, rat intestine, rat carcinoma tissue, chick intestine, trout tissues, lobster tissues, cockroach intestine and in the bacteria *Pseudomonas fluorescens* and *Rhizobium trifolii*. They are absent from brewers' yeast and from the molds *Aspergillus parasiticus* and *Penicillium citrinum* and *terrestre*. Pure leucylpeptidase prepns. can be conveniently prepd. by pptn. of crude exts. at pH 6–7 with 1 vol. of Me_2CO. The H_2O-sol. portion of the resulting ppt. contains the enzyme. A. P. Lothrop

Mucinase: a bacterial enzyme which hydrolyzes synovial fluid mucin and other mucins. Wm. van B. Robertson, Marian W. Ropes and Walter Bauer. *J. Biol. Chem.* **133**, 261–76(1940).—An enzyme, *mucinase*, has been isolated from broth cultures of *Clostridium perfringens* and is present in varying concns. in broth cultures of several other microörganisms. Adsorption on $Ca_3(PO_4)_2$ from a 50% Me_2CO soln. concentrates it 900-fold. Mucinase causes loss of viscosity of solns. of synovial fluid mucin or of the prosthetic polysaccharide and subsequent liberation of amino sugars and reducing substances. It is active in the pH range 3.0–8.5. The temp. coeff. is K_{10} 1.75 and inactivation occurs at 60°. A reversible inactivation is caused by removal of salts. It is inactivated irreversibly by cyanide, arsenite or I. Its specificity is significant; it does not hydrolyze mucins from mucous membranes and glands but does hydrolyze mucins formed by mesothelial tissues (umbilical, synovial and connective tissues) as well as vitreous mucin, the histogenetic origin of which is unknown. This specificity suggests that the mucin extd. from connective tissue is identical with that of synovial fluid and gives further support for the concept that synovial fluid is formed, at least in part, by the connective tissue cells surrounding the joints. The fact that the mucins of the tissues so regularly involved in rheumatoid arthritis are digested by mucinase suggests that the presence of mucin in these tissues is of fundamental importance in the localization of this disease. A. P. Lothrop

Absorption and fluorescence spectra in relation to the photolethal action of methylcholanthrene on yeast. Alexander Hollaender, Peter A. Cole and F. S. Brackett. *Am. J. Cancer* **37**, 265–70(1939).—The toxic effect of radiation of wave lengths of 3450–4500 A. on suspensions of yeast was greatly enhanced by the presence of methylcholanthrene (I) in a dil. of 1 to 10^8 and the effect was recognizable in dils. of 1 to 10^9. When the yeast incubated with I in the dark, stimulation of growth was observed, shown by a breaking of the early resting phase. E. R. M.

Protein structure and the Procter-Wilson theory. W. E. Braybrooks. *J. Intern. Soc. Leather Trades' Chem.* **23**, 515–22(1939).—The original theory assumed that the degree of swelling was detd. by a balance between osmotic forces and structural strength of the protein, which latter was thought to be const. But from the zwitterion concept it follows that fixation of acid or alkali reduces structural strength. z (= concn. of protein anions) in the Donnan equil. equation is dependent on the concn. of the protein, i. e., ratio of protein to total H_2O for a sol. protein, or protein to H_2O inside the protein structure in the case of an insol. protein. Calcn. of e (= excess diffusible ions in the internal phase) for different arbitrary values of z indicates that the difference in pH value between the internal and the external soln. increases with the concn. of the gel, that max. swelling pressure increases with gel concn. and that max. swelling occurs at a higher pH in more dil. gels. Resistance to swelling of a protein is detd. by its degree of organization. From observed max. swelling of gelatin, collagen and wool, max. values of e are calcd. as 1 pH unit for leaf gelatin, 1.4 for collagen and 1.6 for wool. The effect of diln. on pH value of max. swelling explains some of the differences previously reported. The difference in effect between HCl and H_2SO_4 is believed to be due to repressed ionization of the second hydrogen of H_2SO_4 below pH = 3.4. Swelling increases with temp. because of the weakening of protein structure caused by heat. H. B. Merrill

The fraction precipitated with trichloroacetic acid in extracts of liver in the first stage of autolysis. Mario Calcinai. *Biochim. terap. sper.* **26**, 407–16(1939).—The fraction that can be pptd. with CCl_3CO_2H and that is contained in exts. from autolyzed guinea-pig livers shows at certain phases an increase which is explained by the theory of new formation of complexes of merely phys. character. The addn. of ascorbic acid to the liver causes an immediate decrease of the precipitable fraction but enhances the increase that follows. A. E. Meyer

Modifications of the complexes precipitable with trichloroacetic acid by the action of hydrogen peroxide on products of cleavage of various proteins. Mario Calcinai. *Biochim. terap. sper.* **26**, 437–48(1939).—The resynthesis of protein by the action of H_2O_2 on a mixt. of egg albumin and peptone digested with papain was investigated by pptg. with CCl_3CO_2H and tannic acid. The digestion was performed at 0 and 37°. Depending on conditions, the quantity of ppt. was increased or decreased; the effect seems to depend on phys. phenomena created by H_2O_2. A. E. Meyer

Electrolysis of blood corpuscles. V. The action of direct current on chicken erythrocytes. L. A. Semenov. *J. Physiol.* (U. S. S. R.) **21**, 271–82 (1936); *Chem. Zentr.* **1938, I**, 4201; cf. Petropavlovskiĭ, *C. A.* **33**, 6363[1].—The action of d. c. on chicken erythrocytes was studied under the microscope by means of a special glass chamber with Pt electrodes. After a certain period, which depended on the magnitude of the applied potential, a hemolysis took place. This phenomenon appeared sooner at the cathode than at the anode. OH ions appearing at the cathode and H ions appearing at the anode were responsible for the qualitatively different types of changes occurring. M. G. Moore

Group enzymes of saliva. N. I. Blinov and L. D. Zaslavskiĭ. *J. Physiol.* (U. S. S. R.) **22**, 878–84(1937); *Chem. Zentr.* **1938, I**, 4193.—The group substance A in pepsin and peptone is not destroyed by the group enzyme of human blood of the A group; on the other hand, it is completely destroyed by the enzyme of human blood of groups B and O. Upon mixing a pepsin soln. with serum of the blood group B, the group substance of the pepsin forms a compd. with the agglutinin which is not destroyed by the group enzymes of saliva. M. G. Moore

The phenomenon of autocatalysis in biology. N. B. Medvedeva. *Klin. Med.* (U. S. S. R.) **15**, 1080–3 (1937); *Chem. Zentr.* **1938, I**, 4477.—An effort is made to apply the chem. concept of autocatalysis to various biol. processes. M. G. Moore

Secretin and its biochemistry. V. Celentano. *Riv. fis., mat. sci. nat.* **12**, 256–8(1938); *Chem. Zentr.* **1938, I**, 4199.—A review of the discovery and properties of the substance M. G. Moore

Methemoglobin formation. XIII. Pyridine. Herbert Riedel. *Arch. exptl. Path. Pharmakol.* **192**, 39–42(1939); cf. *Ibid.* **190**, 224–5(1938).—By means of absorption spectra, it is proved that dil. aq. solns. of pure pyridine do form methemoglobin with hemolyzed blood, as previously suggested. Cf. *C. A.* **33**, 3880[9]. J. Pinchack

Xanthine oxidase and milk flavoprotein. H. S. Corran, J. G. Dewan, A. H. Gordon and D. E. Green. *Biochem. J.* **33**, 1694–1706(1939).—A method was described for prepg. a flavoprotein from milk. The flavoprotein catalyzed the oxidation of hypoxanthine, aldehydes and dihydrocoenzyme I and was about 1000 times more active per mg. dry wt. than milk. The 3 catalytic activities, although assocd. with the same flavoprotein, could be differentially inactivated. Drying and incubation with cyanide abolished hypoxanthine-aldehyde activity without affecting either dihydrocoenzyme I activity or the spectral and chem. properties of the flavoprotein. The flavin moiety was very similar to, if not identical with, flavinadenine dinucleotide. Flavin accounted for only 35% of the total absorption at 450 mμ. Evidence was noted for the existence of a colored nonflavin group in the mol. The catalytic role of this addnl. group was not clarified. No direct evidence was obtained to show that the flavin groups undergo a cycle, first of reduction by the

3 substrates and then of oxidation by oxidizing agents. **Addendum.** J. St. L. Philpot. *Ibid.* 1707–8.—Examn. of this new material in the ultracentrifuge indicated that there were 1.4–3.1 flavin groups per mol. The previous conclusion, based on higher flavin content, that there were 8 flavin groups per mol. has been revised. Cf. *C. A.* **32**, 3230[4]. E. W. Scott

The actions of iodine and hypoiodous acid on pepsin. John St. L. Philpot and Percy A. Small. *Biochem. J.* **33**, 1727–33(1939).—When I acted on pepsin the initial ratio of fall in Folin blue value to fall in peptic activity decreased with increasing pH and temp., reaching a very low figure at pH 6 and 38°. The same result was obtained with pepsin that had been first treated with HNO_2. When pepsin was treated with HIO the initial ratio of fall in Folin blue value to amt. of HIO was much lower than for tyrosine, being practically nil at pH 5.4. The amt. of HIO required to produce a faintly perceptible fall in the Folin blue value was sufficient to destroy most of the peptic activity. Conclusion: Groups other than tyrosine are concerned in the effect of I and HIO on the peptic activity of pepsin and these groups are probably not other amino acids. E. W. Scott

The spreading of different hemoglobins, muscle hemoglobins and cytochrome c. J. H. P. Jonxis. *Biochem. J.* **33**, 1743–51(1939).—The max. areas of all hemoglobins in the compressed state were the same, 9400 sq. cm. per mg.; this indicated that they contained the same no. of amino acids per Svedberg unit. The time after which the max. area was reached at the isoelec. point differed for the various hemoglobins and was independent of the total ion concn. of the soln. on which the films were spread. Small amts. of urea had no influence, but concd. solns. of urea decreased the unfolding time and the surface-pressure curve was flattened. In these solns. there were no differences in the behavior of horse and sheep hemoglobins, although the former was dissocd. into mols. of half the normal mol. wt. and the latter was not. Reduced hemoglobin spread more rapidly than oxyhemoglobin. Oxidized cytochrome spread more rapidly than reduced cytochrome. Muscle hemoglobin did not form monolayers on solns. at a pH between 4 and 11, but reduced muscle hemoglobin formed monolayers at pH 6.8. The max. area was reached after 5 min. E. W. Scott

Peptic digestion of egg albumin. Arne Tiselius and Inga-Britta Eriksson-Quensel. *Biochem. J.* **33**, 1752–6 (1939).—A study of solns. of egg albumin partially digested with cryst. pepsin in AcOH medium, using electrophoresis, sedimentation and diffusion methods, indicated that appreciable amts. of unchanged, acid-denatured egg albumin were present even after prolonged digestion, together with the end products, whereas no significant amt. of intermediary split products could be observed. This result suggests that the peptic digestion of egg albumin is an "all-or-none" type of reaction rather than a gradual breakdown process. E. W. Scott

The mechanism of urea formation. Stefan J. Bach. *Biochem. J.* **33**, 1833–44(1939).—Citrulline (I), when added to liver slices in the presence of NH_4 lactate (II), gave rise to urea. The ratio: ammonia-N disappearance to urea-N formation was approx. 1. Amino N remained practically unchanged during the synthesis and was markedly increased when I was replaced by arginine (III); hence no ornithine (IV) was formed from I. A marked urea formation was also obtained in the presence of II but in the absence of I or any other amino acid. When II was replaced by α-ketoglutaric acid (V) and NH_4Cl the urea formed in the absence of I was accompanied by a rise in the amino N and amide N (interpreted as a synthesis of glutamine (VI)). Urea formation in this case was inhibited by glycine and partially by alanine owing to their action on V, during which amino N disappeared. The fact that formation of a small amt. of urea took place in the presence of I and V or pyruvic acid in the absence of NH_3 indicated that I is oxidized by ketonic acids to form urea and glutamic acid (II). VI and VII gave rise to urea in the presence of NH_3, but not in its absence. The results suggest a cyclic formation and disappearance of VI, which catalyzes urea synthesis. IV also gave rise to urea formation in the presence of V and NH_4Cl, but not in the absence of the latter. Urea synthesis from III in the presence of V and NH_4Cl was 3 times as fast, and from I 1.5 times as fast as from IV. Amino N was markedly increased with III. The disappearance of NH_3 was the same in the 3 cases. The role of CO_2 or its precursors as a source of C for the urea was studied. HCO_3Na markedly increased the formation of urea from VI and VII in the presence of NH_4Cl. A scheme was outlined suggesting urea synthesis from IV, from I and also by hydrolysis from III, thus connecting the mechanism shown by Krebs (*C. A.* **27**, 760, 3978) with that observed by Leuthardt (*C. A.* **32**, 4640[2]). E. W. Scott

Chemical properties of ascorbic acid oxidase. II. Tetutaro Tadokoro and Naomiki Takasugi. *J. Chem. Soc. Japan* **60**, 61–3(1939); cf. *C. A.* **33**, 2154[7]; **34**, 2405[1].—Action of pancreatin upon the ascorbic acid oxidase (I) of cucumber juice was detd. as follows: To 2 mg. pancreatin add 2 cc. cucumber juice and 1 cc. citrate buffer of pH 7.8. After 2 hrs. at 37° add a buffer of pH 3.8 to bring the pH of the mixt. to 5.8. Add 2 cc. ascorbic acid soln. and after 1.5 hrs. at 37° titrate with Tillmann's indophenol soln. Compare with a blank in which pancreatin is omitted. The test soln. consumed 1.1 cc. of the indophenol soln., the blank 2.05 cc.; this indicates a considerable decrease in I activity by pancreatic digestion. A mixt. of 1 cc. of pumpkin juice, 1 cc. buffer of pH 5.8 and ascorbic acid soln. was kept for 1.5 hrs. at 37°. A mixt. of equal amts. of metaphosphate and sulfosalicylic acid solns. was then added, and the resulting soln. was titrated as above. The test soln. consumed 0.52 cc. of indophenol, the blank 2.0 cc. This indicates the presence of I in pumpkin juice. Acetone-treated pumpkin juice has less I activity than has juice obtained by boiling and $(NH_4)_2SO_4$ treatment. The supposition that ascorbic acid in plant tissues is in combination with proteins and other substances was proved by the following expt.: To pumpkin juice ascorbic acid soln. and a buffer of pH 5.8 were added and the mixt. was kept for 2 hrs. at 38°. Crystals formed on cooling were washed with acetone to remove free ascorbic acid. From the crystals a large amt. of ascorbic acid was extd. by metaphosphate soln. The filtrate was adjusted to pH 7.0 and shaken for 2 hrs. with china clay. The clay was washed with water and acetone, and extd. with 2% metaphosphate soln. This ext. contained a large amt. of ascorbic acid. The soln. obtained by the extn. of the clay with dil. alkali gave biuret, xanthoproteic, and Millon reactions for protein. Albumin obtained from filtered cucumber juice by treatment with $(NH_4)_2SO_4$ and pptn. with alc. contained C 46.86, H 6.45, N 18.79, P 0.34%; it is higher in N and P and lower in C than milk proteins and phaseolin.

K. Shinohara

Phosphorescence of the three last rings of the glow-worm. Georges Brooks. *Compt. rend.* **210**, 228–30 (1940).—Spectroscopic examn. of the greenish yellow light emitted from the 3 last abdominal rings of the glow-worm show the phosphorescent material to which it is due to contain a considerable amt. of flavin in the state of flavoproteid. The spectrum extends from λ 5700 to 5620 A. Cf. *C. A.* **33**, 4681[6], 8220[7]. C. A. S.

Photodynamic effect on oral mucosa. II. The role of omentum. Tinkyoku Hai. *J. Chosen Med. Assoc.* 29, 2595–607 (German abstr. 157–8) (1939); cf. *C. A.* **34**, 1696[8].—Omentectomy temporarily increases photodynamic effect (*A*) on oral mucosa if trypaflavine is injected intravenously, as a result of loss of a part of the reticulo-endothelial system (*R*). When an aq. ext. of omentum is given intravenously, *A* is greatly increased. Omentum must contain an active principle that makes oral mucosa more photosensitive to sunlight in the presence of the dye. **III. Relation between endogenous photodynamic substance and reticulo-endothelial system in hepatic disorder.** *Ibid.* 2608–24(German abstr. 158–9).—The rabbit with biliary obstruction or treated with hepatic poisons produces an endogenous photosensitive substance, since the oral mucosa suffers a similar reaction on exposure

to sunlight without trypaflavine injection. The presence of porphyrins is probably responsible. This action of endogenous photodynamic substance is also accelerated by the stimulation of *R* and diminished by blockade of *R* or splenectomy. **IV. Relation between sensitivity of oral mucosa to ultraviolet rays and reticulo-endothelial system.** *Ibid.* 2625–38(German abstr. 159–60).—The sensitivity of oral mucosa to ultraviolet rays increases as *R* is stimulated and decreases when *R* is blocked. Lithioncarmine and India ink produce the same effect on *R*. In either case, ultraviolet-sensitive substance is formed in the blood, the quantity of which is detd. by the extent of the damage to *R*. S. Tashiro

Mechanism of the enzymic phosphorylation of thiamine. M. A. Lipton and C. A. Elvehjem. *Nature* **145**, 226–7 (1940); cf. *C. A.* **32**, 6272[7].—The production of cocarboxylase and adenylic acid by the enzymic phosphorylation of thiamine can be accelerated in the presence of phosphoglyceric acid. Synthesis is stimulated by the addn. of cozymase and inhibited by iodoacetate. This is explained by the finding that glucose inhibits the synthesis of cocarboxylase in the presence of phosphoglyceric acid and adenylic acid. E. D. Walter

The constitution of conjugated phenolphthalein formed in the animal body. August A. Di Somma. *J. Biol. Chem.* **133**, 277–84(1940).—Phenolphthalein injected into rabbits and guinea pigs is excreted in the urine in conjugated form as phenolphthalein mono-β-glucuronide. It was crystd. as the cinchonidine salt which contains 1 mol. of alc. or dioxane of crystn. None was excreted as the sulfate. At best only about 45% of the administered drug was recovered, indicating that a large proportion had been broken down. The chem. properties of the conjugate are described. A. P. Lothrop

B—METHODS AND APPARATUS

Hormone studies in the ultracentrifuge. III. An application of Toepler's schlieren method to the analytical ultracentrifuge. James A. Chiles, Jr., and Aura E. Severinghaus. *Rev. Sci. Instruments* **11**, 71–6(1940); cf. *C. A.* **32**, 8532[6].—An image of a slit is formed by a schlieren lens just above a knife-edge diaphragm. The slit image is deflected by a sedimentation boundary, having a refractive index gradient, placed between the lens and the slit. The movement of the boundary in a centrifugal force field is followed by moving the knife edge. The optical system and centrifuge are described with the aid of 4 figures. The instrument is calcd. to be able to detect index gradients of the order of 5×10^{-4} per cm. H. G. Bowlus

Nebulizer for inhalation experiments. Rolland J. Main. *Ind. Eng. Chem., Anal. Ed.* **12**, 117(1940).—An all-glass nebulizer capable of producing a stable smoke-like mist without spattering is described. At 11 lb. per sq. in. air pressure the app. uses 4.5 to 8 cc. of kerosene soln. per hr. and 8 l. of air per min. W. F. Bruce

Method of plasma phosphatase determination for differentiation of alveolar crest bone types in periodontal disease. Rudolph H. Pelzer. *J. Dental Research* **19**, 73–85(1940).—Add blood (50 cu. mm.) to 1000 cu. mm. 0.9% NaCl soln., and remove the corpuscles by centrifugation. To 200 cu. mm. of the supernatant liquid add 200 cu. mm. of substrate (contg. 8 cc. *N* NH_4OH, 12 cc. *N* NH_4Cl, 1 g. Na_2 β-glycerophosphate and 2 cc. *M* $MgCl_2$, dild. to 100 cc. with H_2O). Incubate for 24 hrs. at a temp. of 37°, then add 300 cu. mm. 10% AcOH. Make a control expt., omitting the incubation. Remove the ppt. by centrifugation, and det. phosphate colorimetrically, using 400 cu. mm. of the supernatant liquid, 100 cu. mm. of H_2SO_4-molybdate soln. (100 cc. 7.5% $(NH_4)_2SO_4$ soln. + 45 cc. 10 *N* H_2SO_4 + 105 cc. H_2O) and 100 cu. mm. of amidol soln. (15 g. amidol + 15 g. Na_2SO_4 in 100 cc. H_2O, and dild. 5-fold with H_2O prior to use). Allow 15 min. for development of the blue color. The mean no. of units of blood plasma phosphatase were: Radiographically normal and arrested alveolar bone, finger plasma 11.9, gingiva plasma 12.6, radiographically slow alveolar crest bone destruction, finger plasma 7.6, gingiva plasma 14.2, radiographically rapid alveolar crest bone dissoln., finger plasma 7.8, gingiva plasma 20.0. The phosphate differences (gingiva-finger) in the 3 groups were, resp., 0.6, 6.6 and 12.1 units. In 6 cases, plasma phosphatase was not increased in the region of alveolar crest bone destruction. 16 references. Joseph S. Hepburn

Ascorbic acid determination. L. Rosenthaler. *Z. Vitaminforsch.* **9**, 342–4(1939).—In an acid (HCl) soln., ascorbic acid reduces $HgCl_2$ to HgCl. The latter compd. is either weighed or detd. iodometrically. J. S. H.

Preparation and properties of a potent lactic dehydrogenase powder. Charles Gurchot and Arnold Lowman. *Univ. Calif., Pub. Pharmacol.* **1**, 221–34(1939).—A lactic dehydrogenase powder was prepd. from washed bakers' yeast by grinding it in a ball mill for 18 hrs. with *M*/15 phosphate buffer of pH 5.5 with Et_2O as a bactericide, centrifugation at 2000 r.p.m. for 2 hrs., pptn. by means of $(NH_4)_2SO_4$, and drying. The product contained lactic dehydrogenase, catalase, protein and no sulfhydryl groups. The dehydrogenase was activated by cysteine, apparently by deinhibition, had an optimum temp. of 26°, an optimum pH of 5.2–5.5, an activity inversely proportional to the log of the concn. of the reagents but linear for methylene blue. A standard lactic dehydrogenase powder is a prepn. 25 mg. of which reduces 0.4 mg. methylene blue per min. at a temp. of 26°, a pH of 5.2, and a total vol. of 10 cc. Joseph S. Hepburn

The estimation of histidine. Richard J. Block. *J. Biol. Chem.* **133**, 67–9(1940).—The histidine present in a protein hydrolyzate can be quantitatively recovered by pptn. with Ag at pH 7.4 followed by pptn. by nitranilic acid and weighing the histidine nitranilate. It must be remembered, however, that a varying proportion of the histidine may be destroyed during hydrolysis with 8 *N* H_2SO_4. Recoveries of histidine added to hydrolyzates of gelatin, casein and blood proteins were 99, 96 and 103%, resp. A. P. Lothrop

Determination of paraldehyde in biological fluids. Harry Levine and Meyer Bodansky. *J. Biol. Chem.* **133**,

193–8(1940).—The paraldehyde is removed from the biol. fluid by vacuum distn. and bubbled through a $K_2Cr_2O_7$-H_2SO_4 oxidizing mixt. and the excess of dichromate is titrated iodometrically with $Na_2S_2O_3$. The paraldehyde depolymerizes to MeCHO which is immediately oxidized to AcOH. The method is simple, rapid and accurate and duplicate detns. check within 1.5 mg. % when a microburet is used and within 3 mg. % with an ordinary buret. The method permits detn. of concns. up to 500 mg. with 2-ml. samples and 1 g. % with 1-ml. samples. A. P. L.

A simple oxygen analyzer for use in oxygen-tent therapy. Capt. S. Hoechstetter. *Military Surgeon* **85**, 384–6(1939). —The app. for O-tent gas analysis consists of a 20-ml. syringe contg. a roll of copper screen extending from the tip to the 12- or 13-ml. mark. A rubber stopper connects the tip to a 10-ml. syringe. The large syringe is filled with reagent, 1 part 28% ammonia to 2 parts satd. NH_4Cl soln., and excess is expelled by pushing the plunger against the screen. A 10-ml. sample is introduced from the moistened small syringe. After rocking gently 1 min. the gas is returned to the 10-ml. syringe for vol. measurement. Percentage of O_2 equals 10 (10-residual vol.). Av. error is −1%, the range −4 to +2%. Analysis should be checked frequently with atm. air. Janet McAfee

Method of colorimetric determinations in fluids from organisms and in other biological material. Renzo Benigni. *Biochim. terap. sper.* **26**, 397–406(1939).—Colorimetric standards are frequently difficult to prep. because (1) the test fluid contains coloring matter that cannot be matched, (2) other substances present influence the shade of the color developed by the reaction. Prep. a standard contg. *a* mg. per cc., in a solvent miscible with the fluid to be tested. Mix 1 cc. of the latter with 1 cc. standard and another cc. with 1 cc. of the solvent. The quantity of substance to be detd. is in the first sample $x + a$, in the second x. Otherwise the compn. is the same in both fluids; this leads to a perfect match of colors developed by the reaction. The variable influence of the natural color of the fluid itself can be eliminated by the use of monochromatic light corresponding to the color of the reaction. A combination of colorimeter with spectroscope is recommended. A. E. Meyer

The determination of nitrogen according to the method of Acel. I. I. Kotlyarov. *J. Physiol.* (U. S. S. R.) **21**, 317–19(1936); *Chem. Zentr.* **1938, I**, 4360.—For the *detn. of residual N in the blood* the method of Acel (cf. *C. A.* **15**, 3649) was modified so as to use the Dubosque colorimeter. Mix a 0.5-cc. sample of blood with 5.5 cc. of phosphomolybdic acid according to the procedure of Bang (cf. *C. A.* **13**, 27) and filter after 30 min. In test tubes 1 and 2 heat a drop of concd. H_2SO_4 with 0.5 cc. of the filtrate until fumes of SO_3 appear and, after the addn. of a drop of H_2O_2, ash over a period of 15–20 sec. In test tubes 3 and 4 ash a drop of H_2SO_4 and a drop of H_2O_2 without the addn. of filtrate in like manner. Test tube no. 3 serves for the detn. of the N in the reagents and no. 4 for the soln. for comparison. Dil. the solns. to 15 cc. with water and add 0.3 cc. 50% NaOH and 0.5 cc. Nessler reagent. To test tube no. 4, after the addn. of water, add 0.5 cc. of an $(NH_4)_2SO_4$ soln. contg. exactly 0.05 mg. N per cc. Colorimetrically compare the solns. in test tubes 1, 2 and 3 with that in 4. Calc. the N content of the blood sample in the usual manner, making a correction for the N contained in the reagents. This modification of the method reduces the mean error to 1.4%. M. G. M.

The use of the method of Nicloux-Osuka for the determination of residual carbon in the blood and of carbon in the urine in the presence of protein. I. I. Kotlyarov. *J. Physiol.* (U. S. S. R.) **21**, 321–4(1936); *Chem. Zentr.* **1938, I**, 4360.—In the detn. of the C:N ratio in the blood and urine after extirpation of the suprarenal capsules, the method of Osuka (cf. *C. A.* **26**, 2480) was used not only for the detn. of C in the urine but also for that of the residual C in the blood. The blood protein was pptd. with phosphotungstic acid according to the method of Stepp. A 10–20-cc. portion of the filtrate in a small flask was neutralized, in accordance with the method of Osuka, with 2 *N* KOH, a drop of 0.05 *N* NaOH to which methyl red had been added serving as indicator. By use of the vacuum created by a water pump, the liquid in the flask was evapd. at 40°. The residue was then ashed according to the method of Osuka. Albumin-contg. urine was treated in like manner. The vol. of the small flask in the app. of Osuka was increased to 50 cc. Control detns. of the C in urea gave a mean error of 1.4%. The difference between the results of parallel detns. was on an av. 2.9% for blood and 2% for urine. M. G. Moore

The intravenous dextrose-tolerance test. R. E. Tunbridge and E. C. Allibone. *Quart. J. Med.* **9**, 11–35 (1940).—A standard test is suggested in which 27.6 g. of dextrose is injected intravenously in 3 min. (92 cc. of 30% aq. dextrose soln.). Samples of blood (0.1 cc.) are taken from the lobe of the ear at intervals of 1.5 to 7.5 min. for 60 min. after the end of the injection. With 40 healthy medical students the blood sugar returned to the preinjection level within 60 min. With diabetic patients the time was longer. The actual time was const. for each normal person but differed with different individuals. The response is altered by age, infection, disease, diet and the amt. of dextrose injected but not by normal variations in wt. or by the substitution of isotonic saline for water as a solvent for the dextrose. 82 references. J. T. Myers

Detection of chloralose in urine. P. Cheramy. *Ann. méd. légale criminol. police sci.* **19**, 630–1(1939).—Reflux 20 cc. urine + 1 cc. H_2SO_4 + 0.5 g. charcoal (e. g., Norit) for 5–10 min., cool and filter; to the filtrate in a test tube add 2–3 cc. colorless C_5H_5N and an equal vol. of NaOH soln. (presumably 17–25%), shake well and heat 1–2 min. in a boiling-water bath. In presence of chloralose (0.1 g. per l. or more) the supernatant C_5H_5N turns pink to cherry red. The reaction is also given by chloral, $CHCl_3$, $CHBr_3$, CHI_3, but not by barbiturates, and is therefore useful to eliminate possibility of intoxication by the latter. A. Papineau-Couture

The detection of the rupture of fetal membranes [through change in vagi. pH] with the nitrazine indicator. Tom Abe. *Am. J. Obstet. Gynecol.* **39**, 400–4(1940). J. Pinchack

Studies on preservation and use for transfusion of placental blood. Charles S. Fine, Robert L. Alter and Arthur Baptisti, Jr. *Am. J. Obstet. Gynecol.* **39**, 462–8 (1940).—The use of placental blood for transfusion is impractical because of tech. difficulties in its collection and sterile preservation. The best preservative is 1.5% Na citrate in *N* saline. J. Pinchack

A specific method for determining alcohol in blood. H. Kluge. *Z. Untersuch. Lebensm.* **78**, 449–58(1939).—The Et dinitrobenzoate deriv. is prepd., identified, sapond. and the amt. of C_2H_5OH detd. Heat just to boiling 0.2 g. of recrystd. 3,5-dinitrobenzoyl chloride and 5 cc. C_6H_6 in a 100-cc. Erlenmeyer flask under reflux. In a 100-cc. flask add 30 cc. C_6H_6, 2 g. anhyd. $CuSO_4$ and dropwise while shaking 1 cc. of sample (blood serum, urine, etc.). On lumping, disintegrate the $CuSO_4$ with a thick glass rod and treat the mixt. with an addnl. 2 g. of $CuSO_4$. Stopper and shake 30 min. Place in a centrifuge tube and centrifuge. Pour 25 cc. of the clear soln. down the reflux condenser into the 5 cc. C_6H_6 and dinitrobenzoyl chloride mixt., add 0.1 cc. pyridine, let stand ½ hr., bring to boiling and allow to stand ½ hr. at room temp. Boil and let stand ½ hr. again, then reflux gently for 4 hrs., during which add dry C_6H_6 to replace any lost during the process. Remove reflux, cool in water bath and pour into a separatory funnel contg. 10 cc. of 5% HCl. Shake well, remove aq. soln. and wash twice with water. Filter the reaction mixt. through a fluted filter into a measuring cylinder. Det. the alc. in the aliquot (about 24 cc.) according to the method of Liebesny as described by Heiduschka and Steulmann (*C. A.* **31**, 1444[1]). With known samples the method proved accurate and also checks other known methods on blood samples. For qual. identification evap. the reaction mixt. after it has been washed with dil. HCl and water, and filter. Take up the residue twice with petr. ether and evap. Take up with ether again, wash with 1% NaOH soln., filter and evap. The crystals obtained with samples contg. C_2H_5OH should melt at 93°. Other criteria for

identification are crystal form, soly., mixed m. p. with pure ester, detn. of C, H, N and O and color reaction with α-naphthylamine. The latter is used for small yields of crystals. The procedure is more tedious and time consuming than other common methods but since it is specific, it should serve that purpose in medico-legal chemistry. M. M. Piskur

Colloid reaction in the diagnosis of cerebrospinal fluid. Werner Herrmann. *Kolloid-Z.* **89**, 297–301(1939).—The prepn. of Au sol according to the Fowweather method (cf. *C. A.* **23**, 405) is described. This sol is more easily prepd. than other sols and more sensitive to pathol. protein. The collargol reaction of Riebeling (*C. A.* **32**, 8488[8]) is a valuable contribution to the research methods of colloid chemistry. The Au sol and collargol reactions have different chem. bases. They can be used to det. different pathol. constituents of the cerebrospinal fluid. Both methods should be used for complete diagnosis of the cerebrospinal fluid. Felix Saunders

A critical examination of the chemical methods for determining ascorbic acid, and a method for the titration of ascorbic acid in strongly colored berries and fruits. Lisa Swenander Lanke. *Kgl. Fysiograf. Sällskap. Lund, Forh.* **8**, 225–43(1938)(Pub. 1939)(in German).—See *C. A.* **33**, 5019[8]. W. C. Tobie

A colorimetric semimicrodetermination permitting the control of arsenuria in the neoarsphenamine treatment in massive doses. J. V. Harispe. *J. pharm. chim.* **30**, 58–70(1939).—See *C. A.* **33**, 9346[9]. S. Waldbott

Determination of carotene. Geo. Kernohan. *Science* **90**, 623(1939).—A 1-g. sample of alfalfa is placed in a flask, to which is added 100 cc. of petr. ether. The flask is stoppered and set aside overnight. The soln. of plant pigments is poured on a column of finely divided soda ash and drawn through the column by the aid of suction. A chromatograph of the various plant pigments forms on the column with the sepn. of carotene, which passes through with the petr. ether. The carotene should be washed through with more petr. ether. F. S.

Standard Methods of the Division of Laboratories and Research of the New York State Department of Health. 2nd ed. **Augustus B. Wadsworth**, Director. Baltimore: Williams & Wilkins. 681 pp. $7.50.

D—BOTANY

THOMAS G. PHILLIPS

Ecological studies on the rain forest of Southern Nigeria. II. The atmospheric environmental conditions. G. C. Evans. *J. Ecol.* **27**, 436–82(1939); cf. *C. A.* **33**, 9510[1].—The concn. of CO_2 in the undergrowth of the Nigerian rain forest did not exceed 0.06% by vol., and thus was of the same order as that in temperate woods. There was a marked diurnal variation; values much above "normal" were recorded only in the morning and there was a steady fall from sunrise to noon. There were no significant differences between the concns. observed in primary and in 14-yr.-old secondary forest. J. R. Adams

"Second growth" of potato tubers. K. Schmalfuss. *Angew. Botan.* **20**, 430–3(1938).—The basal (older) portion of tubers showing "second growth" (occurring after heavy rain following a dry period) contains more water and total and reducing sugars and less starch, protein and total N than does the new growth. B. C. P. A.

Comparative effects of cobalt, nickel and copper on plant growth. W. E. Brenchley. *Ann. Applied Biol.* **25**, 671–94(1938).—In water cultures small concns. of Co, Ni and Cu bivalent ions have no detrimental effects on barley or beans. With increasing concns. toxic symptoms appear abruptly at concns. which differ for each element and for each species. Cu was more toxic than Co or Ni, and $CuCl_2$ than $CuSO_4$, to barley. Beans were affected more by Co than by Cu or Ni. Cu in toxic proportions caused shortening and bunching of barley whereas Ni and Co caused attenuation but not shortening. B. C. P. A.

Variation in [plant] cellular function according to the composition and concentration of the nutrient solution. P. Mazé, P. J. Mazé, Jr., and R. Anxionnaz. *Ann. inst. Pasteur* **62**, 224–48(1939).—The method of culture in which the root system is divided between two independent solns. (*C. A.* **32**, 1752[8]) is further developed. Effects of the concn. of the nutrient and of light intensity on growth and on intake of water and nutrients by corn plants are examd. The alky. of the ash of roots immersed in water exceeds that of roots placed in a complete nutrient soln. When part of the root is placed in aq. KI and part in a complete nutrient the intake of I is inversely related to the concn. of the complete nutrient. Comparison of the rates of intake of N from various nitrates and NH_4 salts shows N to enter the root in an ionic form, the ratio of cations to anions absorbed varying with the N source. The rate of intake of NH_4 ions may be greater or less than that of NO_3 ions according to the concn. of nutrient supplied. B. C. P. A.

Genetics and chemistry of flower color variation in Lathyrus odoratus. G. H. Beale, G. M. Robinson, R. Robinson and R. Scott-Moncrieff. *J. Genetics* **37**, 375–88(1939).—The inheritance of two new color factors is examd., viz., "bright" an incomplete recessive, and "salmon" a recessive factor hypostatic to red. The factors red and salmon are assocd. with a difference in the degree of oxidation of anthocyanins in the flowers and that of leucoanthocyanins in seed coats. The factor "dull" is associated with a pH difference in flower saps. Seven factors, dark wing, copper, maroon, mauve, bright, picotee and hooded, are associated with differences in relative amts. of anthocyanin and anthoxanthin copigment. Variation in methylation of anthocyanin is correlated with quantity of anthoxanthin. B. C. P. A.

Energetics of germinating seeds. II. Wanda Sołodkowska. *Roczniki Chem.* **19**, 277–88(1939).—The O_2 intake and CO_2 output of sunflower seeds rise to a max. on the 4th day of germination when the R. Q. is min. On the assumption that the heat of germination (815.3 g.-cal. perg.) is due to oxidation of fats alone, and on the basis of the above results, it is calcd. that combustion of fats yields 602.3, and transformation into carbohydrates 274.3, a total of 876.6 g.-cal. perg. Cf. *C. A.* **33**, 6392[1]. B. C. P. A.

The autumnal yellowing of beet leaves. Henri Colin and Simone Lemoyne. *Compt. rend.* **209**, 970–2(1939); cf. *C. A.* **29**, 8386[5]; **31**, 1072[1]; **32**, 2977[1].—At the end of the season the parenchyma of the green and the yellow, older outer beet leaves contain 17.4 and 18.6% dry matter, resp. The percentages of various components in the dry matter of the green and the yellow leaves are as follows: reducing sugars 4.36, 9.65; sucrose 4.03, 4.03; sol. org. N 1.15, 0.81; insol. org. N 2.85, 1.52; sol. P 0.118, 0.101; insol. P 0.145, 0.089; sol. ash 9.9, 8.2; insol. ash 4.8, 5.0; sol. alky. (in cc. *N* soln.) 94, 70.5; insol. alky. 112, 102.5, resp. Migration toward the root probably causes the lower org. N content of the yellow leaves. Younger leaves, taken at the same time, contain on an av. 15% dry matter, 7% sugar, 17% ash and 5% N, most of which is insol. Ruth Berggren

The assimilation of carbon dioxide by green plants. III. The light absorption of suspensions of algae. W. Noddack and H. J. Eichhoff. *Z. physik. Chem.* **A185**, 241–59(1939); cf. *C. A.* **34**, 2415[1].—Light was passed through suspensions of *Chlorella pyrenoidosa* and the intensity of the light emerging was detd. as a function of the angle of emergence. This was done for dil. and concd. (approx. 1.14×10^7 algae/cc.) suspensions with wave lengths of 6600 and 5420 A. From the absorption of the normal suspensions and of suspensions decolorized with Br water the absorption due to the pigments in the living cell was evaluated. An *ellipsoidal photometer* for collecting all the light emerging from a scattering body is described; with this app. the light absorption of chlorophyll in ether soln. and in the living cell was detd. as a function of λ from 5150 to 8325 A. The curves obtained in the 2 cases are similar in shape but the max. and min. absorptions in ether soln. occur at lower λ than the corresponding values in the cell. In the cell the max. absorption is at 6680 A.; in ether soln. it is at 6580 A. On the long-wave-length side of the max. the absorption in ether soln. is lower than in the cell:

on the other side and at the max. it is considerably greater. T. H. Dunkelberger

Physiological study of the winter wheat plant at different stages of its development. Edwin C. Miller. *Kansas Agr. Expt. Sta., Tech. Bull.* **47**, 2-167(1939).—The extensive data are presented in 28 tables. Kanred and Harvest Queen varieties were studied for several seasons. The N content of the 2 varieties at different periods of growth were similar. There was a marked decrease in the N content of the stem from the beginning of grain formation to maturity. The amt. of N, expressed in g. per 100 plants, increased in amt. from the seedling stage in early Oct. to the middle of May. The decrease in N after that period per week varied from 1.5 to 17.5% of the total amt. present the preceding week. The amt. of N absorbed by wheat plants from Oct. to Mar. was very small. From 80 to 90% of the N in the plants was absorbed during the 7-12 weeks following the middle of March. The max. amt. of N in the stems and leaves occurred at heading time. The protein-free N in the stems and leaves ranged from 14% to 38% of the total N. The amt. of total P in the stems and leaves and other aerial parts never reached 1% on a dry basis. The max. percentage of about 0.8% was reached in the 1st seedlings and the min. or 0.03% at harvest time. The P content of Kanred was always lower than that of Harvest Queen. P reached its max. in the plants at harvest. The plants absorbed 12–25% of their P by Mar. 1st. The P decreased to a min. in the stem and leaves at or near maturity. A part of the P migrated directly to the grain from the soil. There was a greater amt. of water-sol. P than water-insol. P in both Kanred and Harvest Queen plants. The P in the water-sol. form averaged about 75% of the total. The max. amt. of K in the wheat plants occurred about 4 weeks before harvest. The max. amt. of K in the plants was 6% and the min. 1%. Only 12% of the max. K had been absorbed by the plants by Mar. 15th. K was much reduced in amt. in the stems and leaves with approaching maturity of the grain. At harvest, the grains contained only 45–57% of the max. amt. of K that they possessed 4 weeks earlier. Possibly leaching accounts for some of the loss of K from the plant previous to harvest. The heads of both varieties increased gradually in K content as harvest time approached. The nonreducing sugars predominated in the seed and at all stages of development of the plant. The max. percentage of sugars occurred during the earlier periods of growth. Sugars increased markedly when growth of the plants began in the spring. Sugars were highest in total amt. at the milk stage of the grain. The time of max. sugar in the grain coincided exactly with that of the max. quantity of sugar in the stems and leaves. The greatest gains in the amt. of carbohydrates in the stems and leaves occurred during the earlier stages of the formation of the heads. The percentage of starch in the stems and leaves varied from 0.2 to about 2.5%, but more frequently it was less than 1%. The hemicelluloses increased in amt. in the plant from the seedling stage to maturity but apparently they were not utilized by the plant. When grown under the same conditions Kanred, a typical hard winter wheat, and Harvest Queen, a typical soft winter wheat, showed no striking differences in the amt. or distribution of the various components detd. 92 references. C. R. F.

Effect of root temperature on the absorption of water by the cucumber. R. A. Schroeder. *Missouri Agr. Expt. Sta., Research Bull.* **309**, 3-27(1939).—A deficiency of water in the leaves and fruit causes serious injury to the fall com. cucumber crop in Mo. Respiration is greatly reduced at low temps. Factors which can decrease the flow of water through cucumber roots include increased viscosity of both water and colloidal cellular matter and the reduction in metabolic activity which occurs at lower temps. Injury was marked at 60°F. and could occur up to 70°F. C. R. Fellers

Effect of certain treatments on the carbohydrate reserves of asparagus crowns. L. E. Scott, J. H. Mitchell and R. A. McGinty. *S. Carolina Agr. Expt. Sta., Bull.* **321**, 5-36(1939).—The fleshy roots are permanent carbohydrate storage structures for the asparagus plant. The rhizome is of comparatively little importance in the matter of total storage of reserve food. The reserve carbohydrates are largely nonreducing sugars with a small amt. of starch. Seasonal variation in compn. involved chiefly dry matter and nonreducing sugars, the percentage of reducing sugars and starch remaining fairly const. There was no consistent relation between fertilizer treatment and percentage of carbohydrate reserves in the crown. The rhizome contained most of its sugars in the form of reducing sugars, which may thus possibly be the transitional form of carbohydrates in the asparagus plant. Most of the carbohydrates in the fleshy roots are found in the cortex region. Carbohydrate depletion took place rapidly for about 4 weeks during the harvesting season and following it, until the plants had attained max. growth. Extension of the harvesting season by 2 weeks had no permanent harmful effect on the carbohydrate compn. of the crowns. The chem. studies point to the necessity of maintaining vigorous top growth of the plant until late fall to assure max. production of spears the following spring. C. R. Fellers

Mineral nutrition of higher plants. P. Mazé and P. J. Mazé, Jr. *Compt. rend. soc. biol.* **132**, 375-7(1939).—Corn plants were grown with their roots in liquid media. Small amts. of Co and Ni salts in the medium had an injurious action, small amts. of Ti, V and Be chlorides had a slight beneficial action and K_2CrO_4 had no effect. L. E. Gilson

Absorption of solutions of sucrose by the roots of Zea mays. P. Mazé and P. J. Mazé, Jr. *Compt. rend. soc. biol.* **132**, 377-8(1939); cf. *C. A.* **33**, 4628⁴.—Corn plants were grown with part of their roots in a mineral soln. and part in a sucrose soln. Considerable sucrose was absorbed from a 1% soln. but very little from 2–4% solns. L. E. Gilson

Influence of low temperatures on amylolysis and amylogenesis in the lupine. Georges Deloffre. *Compt. rend. soc. biol.* **132**, 503-4(1939).—Portions of embryonic lupine axes in contact with water or glucose soln at 0–1° carry on amylolysis but not amylogenesis. This suggests that these activities are not due to the same amylase acting reversibly. L. E. Gilson

The incorporation of growth hormones in seed dressings. H. E. Croxall and L. Ogilvie. *J. Pomology Hort. Sci.* **17**, 362-84(1940).—Dry seed dressings (a proprietary mercurial, talc, Cu_2O and ZnO) contg. from 5 to 20 p. p. m. of α-naphthaleneacetic acid, mixed naphthylideneacetic acids and β-indolylbutyric acid were applied to the seeds of 7 varieties of peas and 2 of dwarf beans. No acceleration of the rate of germination occurred in lab. tests. With sterile soil in the greenhouse the rate of emergence of pea seeds was accelerated and the dry wt. of the seedlings after 3 weeks' growth was increased by pretreating the seeds with either talc, Cu_2O or the mercurial dressing, all of which contained the growth-promoting substances. The check to growth caused by the mercurial and Cu_2O dressings under certain greenhouse conditions was greatly reduced or entirely overcome by the incorporation of the hormones with these dressings. In greenhouse soil contaminated with damping-off fungi a higher percentage emergence from several varieties of peas and one of beans was obtained by treating the seeds with hormone-treated dressings than by the use of the same dressings without hormones. In field trials the crop yields of 3 varieties of peas treated with the hormone dressings were up to 80% greater than those from seeds treated with the same dressings without hormones, or from untreated seeds. There was a considerable difference in the response of different varieties to the dressings used. The effect of the dressings contg. hormones varied with different external conditions. No single dressing produced an optimum effect on all varieties and under all conditions. Five p. p. m. of α-naphthaleneacetic acid and mixed naphthylideneacetic acids may safely be used on the varieties of peas and beans employed in these trials, and may cause considerable stimulation under some conditions. Leaf pigments of tobacco. Werner Nagel. *Botan. Arch.* 40, 1–57(1939).—The abs. quantity of chloroplast pigments in the tobacco leaf increases with the growth of the leaf, after which there follows a rapid decompn. The relative value, based on leaf surface or fresh or dry wt., does not parallel the growth but begins to decrease much earlier than does the abs. value. With the exception of the 2–3 youngest leaves, the upper leaves of a plant contain the highest relative amt. of pigments. In the very young leaves (heart leaves), the pigments are not evenly distributed, the tips having the highest concn. The chlorophyll recedes from the basal portion of these leaves, giving in this region a lower ratio: chlorophyll a + chlorophyll b/xanthophyll (x) + carotene (c). In general, a/b increases very early to an av. value of 3–4 and x/c reaches a value of 2–3.5. The ratio of a + b/x + c is in the earliest development of the leaf less than 1, then it increases rapidly to 3–5 and falls again during the early decompn. of chlorophyll to less than 1. No trace of chloroplast pigments was detected in the dead brown leaves. The yellow H_2O-sol. glucoside pigment "rutin" was detected in young leaves, but with ripening the presence of brown red-brown substances interfered with its detn. Increasing the N supply to a certain limit causes a stronger production of pigments, the max. corresponding with max. growth. The dark blue-green leaves resulting from 3 times the normal application of N is due to the higher ratios: a + b/x + c and a/b. The color intensity of the dry brown leaves also increases with the higher N applications. 39 references. C. K. Horner

The chemical composition of flowering bulbs—tulips, hyacinths and narcissi. F. C. Thompson and J. Hargrave. *Agr. Inst. Exptl. Sta., Kirton, Report on Bulb Expts.* No. 6, 34–7(1939).—A review and discussion, with 13 references. K. D. Jacob

Technique in colchicine treatment of pasture plants and seeds. O. E. Sell. *Proc. Assoc. Southern Agr. Workers* 40, 63–4(1939).—Colchicine in even weak concns. allowed only a low survival of alfalfa, bur clover, vetches, crimson clover and subterranean clover. Treatment of these seeds with Hormodin subsequent to the colchicine treatment allowed the use of more concd. colchicine solns. with a satisfactory survival of seedlings. K. D. Jacob

Girdling of cotton plants as affecting survival of Phymatotrichum omnivorum [the causal organism of root rot]. Walter N. Ezekiel. *Proc. Assoc. Southern Agr. Workers* 40, 185(1939).—Plants girdled on July 29 showed bronzing of the foliage in 11 days and a third of the plants died within a month. Meanwhile, there was a rapid decrease in alc.-sol. solids and total sugars in the roots. The roots of the plants showed no viable *P. omnivorum* 3–8 weeks after girdling. Girdling on Sept. 3 produced no change in the above-ground appearance of the plants and had no effect on the viability of *P. omnivorum* on the roots. K. D. Jacob

Permeability of the testa of normal and treated cotton seeds. J. G. Brown. *Proc. Assoc. Southern Agr. Workers* 40, 185–6(1939).—Normal, fuzzy cotton seeds sprouted erratically, whereas acid-treated seeds of the same lot sprouted promptly. Acid-treated seeds absorbed water more rapidly than did normal seeds and in both cases the water intake increased with the temp. The imbibitional "pull" of cotton seeds was strong enough to absorb water from satd. solns. of NaCl and LiCl. K. D. Jacob

Nature of the different forms of urease found in the seeds of various Canavalia. II. Matunosuke Kitagawa and Suburo Yosue. *Bul. Sci. Fakult. Terkultura, Kyusyu Imp. Univ.* 8, 293–312(in English, 313–14)(1939); cf. *Ibid.* 192-202 (in English, 203).—The amts. of urease are compared with the amts. of protein found in the seeds of various *Canavalia*. An American sample of *C. ensiformis* had a protein content (I) of 22.41% and urease activity II (in cc. 0.25 *N* NH_3) per g. of bean meal of 1360; while some Japanese specimens gave a I of 18.30–22.14 and II of 135–1320. Japanese *C. gladiata* had I of 17.41–19.61 and II of 1188–1100. Japanese *C. lineata* gave a II of 183. There seems to be little relation between I and II. Degree of permeability of collodion membrane to urease particles was also studied, as was also the size of the urease particles by means of Elford's ultrafiltration method (*C. A.* 25, 5189). Values for porosity ($m\mu$), urease activities (*N*/25 NH_3 in cc.) before filtration and after filtration, and degree of filtrability of urease particles (%) for 4 samples are: 107, 5.23, 0.34, 6; 202, 5.18, 1.65, 32; 320, 5.23, 2.91, 56; 590, 5.23, 4.68, 89. Values of the filtrabilities of the American and the Japanese jack bean urease are compared. A. H. Krappe

The effect of oxygen surrounding the aerial part of the plant on the elongation of the root and the cell division of the root tip. Hitosi Kozima. *Bul. Sci. Fakult. Terkultura, Kyusyu Imp. Univ.* 8, 315–18(in English, 319–20)(1939).—Continuing previous research on the young root of *Vicia faba*, K. attempted to det. whether or not the root, cultured in an aq. medium from which O_2 had been removed by boiling, could be supplied with the needed O_2 indirectly through the aerial parts of the plant. The aerial parts were kept (1) in normal air, (2) in air from which O_2 had been removed by means of pyrogallol soln. and (3) in pure O_2. The rates of root elongation were small in all 3 sets, amounting to about 10% of that of the control material cultured in O_2-satd. H_2O and to less than 10% of that of the control material cultured in moist sawdust. The frequencies of cell division were equally small, amounting to about 2–3% of those observed in the control plants on sawdust. These facts show that the physiological function of the root tip is hardly affected by the O_2 supplied by the atm. to the aerial part of the plant. A. H. K.

Seasonal changes in the water and reserve-substance content of mulberry stems and roots. Ryohei Taguti. *Bul. Sci. Fakult. Terkultura, Kyusyu Imp. Univ.* 8, 350–71(in German, 372–3)(1939).—The seasonal fluctuations in the content of H_2O, carbohydrates hydrolyzable with dil. acid and crude fats were examd. chemically, i. c., by Kôketsu's powder method (*Botan. Mag.* (Tokyo) 39, 169–75(1925)). The H_2O content was found to be fairly high in spring, to decrease in early summer and to reach a max. about midsummer, to decrease again rapidly in the autumn and more slowly in winter. The carbohydrate content gradually rises from spring to late autumn, when it reaches a max., though it falls temporarily about midsummer. The curve of the fat content is much the same, but it falls in the late autumn, to increase in winter, more so in the bark than in the wood. The max. starch content coincides, in spring, with the min. fat content. The change in the starch content closely agrees with that of the content of hydrolyzable carbohydrates, from which it is concluded that the carbohydrate economy of the mulberry tree is largely based on starch. A. H. Krappe

Biochemical changes in oats affected with the virus disease "zakuklivanie." V. L. Ryzhkov, M. N. Vorob'eva and E. P. Gromuko. *Compt. rend. acad. sci. U. R. S. S.* 24, 301–3(1939)(in English).—Tests disclosed that (1) oat leaves show no important N-content change; the dwarfs increase somewhat in total N and decrease in protein N; (2) the content of reducing and nonreducing sugars and starch is increased by the disease; (3) the ratio carbohydrates/N favors the classification of the disease with the yellows, though there also are some typical symptoms of mosaic; (4) the P metabolism is greatly affected by the disease; the leaves of sick plants decrease in lipoid P and increase in P combined in compds. sol. in 0.05 *N* HCl; (5) the decrease in lipoid P appears to be related to the reduction and disintegration of plastids. 5 references. A. H. Krappe

Thermal denaturation of tobacco mosaic virus. Max A. Lauffer and W. C. Price. *J. Biol. Chem.* 133, 1–15 (1940); cf. *Phytopathology* 29, 20(1939).—The thermal denaturation of tobacco mosaic virus is a reaction of the 1st order and is readily reproducible. The energy of ac-

tivation of the reaction in 0.1 *M* phosphate buffer at pH 7 is about 153,000 cals. per mole. The rate of reaction is strongly influenced by changes in pH and is more rapid in alk. than in acid solns. The rate varies inversely with the initial virus concn. Thermal inactivation proceeds more rapidly than thermal denaturation measured by pptn. A. P. Lothrop

The biological action of metals on the growth of plants. Oreste Cocorullo. *Riv. fis., mat. sci. nat.* **12**, 512–22 (1938); *Chem. Zentr.* **1938, II**, 3409.—The development of seeds of *Raphanus sativus* (radishes) when grown in pots of glass, Pb, Zn and Cu was studied. The controls were grown in wooden boxes. The controls attained a length of 5.31 cm.; the plants grown in glass, Pb, Zn and Cu grew to lengths of 7.80, 6.58, 4.32 and 3.36 cm., resp. M. G. Moore

Potassium deficiency in ammonium- and nitrate-fed tomato plants. M. E. Wall and V. E. Tiedjens. *Science* **91**, 221–2(1940).—Four groups of seedling tomato plants were grown in sand and were supplied with the following solns.: (1) complete nutrients with nitrate N, (2) complete nutrients with ammonium N, (3) lacking K with nitrate N, (4) lacking K with ammonium N. The plants supplied with the 2 complete mediums grew luxuriantly for the duration of the expt. After 3 weeks the plants supplied with (3) showed early deficiency symptoms (stunted growth, foliage contg. abundant starch, pin-point necrotic areas on the curled margins of the older leaves). The plants supplied with (4) exhibited symptoms on the 7th day which were very different from those of the nitrate plants. The foliage was darker green. The plants were stunted and contained considerable starch. This starch rapidly disappeared after 4 days. The leaves wilted and died in 24 hrs. after the appearance of the first symptoms without changing color or exhibiting any of the symptoms assocd. with the nitrate-supplied plants. The comparatively high concn. of NH_4 N in the plants supplied with (4) apparently was responsible for the rapid deterioration and collapse of the leaf tissue. Carbohydrates likewise decreased very rapidly as NH_4 N increased in the foliage. The cause of the injury must be attributed to the lack of K in preventing conversion of NH_4N to amino and protein N. The chem. reactions involved in the metabolic cycles of K-deficient plants supplied with nitrate or ammonium N differ only in that the NH_4 N plants have at hand a large supply of readily assimilated N. The nitrate plants, on the other hand, must first form NH_3 through the reduction of nitrates. Felix Saunders

Experiments with boron on some cereals. W. Schropp and B. Arenz. *Bodenkunde u. Pflanzenernähr.* **16**, 169–84 (1940).—Summer barley, panicled millet and Sudan grass were grown in a modified Crone's nutrient soln. with Hoagland's A-Z without B, the latter specially supplied as H_3BO_3 at 0, 0.01 and 0.1 mg. B/l. for barley and also at 0.5 mg. B/l. for the others. The expts. showed that B is indispensable for all the plants tested. The chief B-deficiency symptom with barley is a continued shoot formation and failure to form kernels; the latter were not formed with 0.01 mg., but normally, with 0.1 mg. B/l. B deficiency was assocd. with a relatively and absolutely greater uptake of N. B had no direct influence either on CO_2 assimilation or protein transformations in the plant. Its action is indirect, and by preventing any unusual swelling of the plasma colloids it has a favorable influence on water economy. The lower requirement for B shown by monocotyls as compared with dicotyls is assocd. with the lack of a secondary growth in stem thickness with the former; if such growth takes place, the H_2O-conducting vessels of the stem may thereby be more or less constricted and their functioning impeded. At the start, these expts. were conducted in glass vessels, and furnished no very conclusive indications, because B was being supplied by the glass; later, vessels of "Mipolam," a polystyrene plastic, were substituted, with sponge rubber used to support the plants therein, and it is believed that no B was then available to the plants, except as it was intentionally added. These expts. showed the abs. necessity for excluding the trace element under study and sufficiently long continuation of the expts. for deficiency symptoms fully to develop. Twenty-four references. C. J. S.

The action of boron on carrots, sunflowers and buckwheat. W. Schropp and B. Arenz. *Bodenkunde u. Pflanzenernähr.* **16**, 185–91(1940).—Expts. similar to those described in the preceding abstr., but in enamelled and glass vessels, and with H_3BO_3 supplied to some at a single rate, 0.5 mg. B/l., led to the conclusion that B is indispensable to carrots, sunflowers and buckwheat. Plants grown without sufficient B assimilated relatively more N, and the ratio of total to protein N in their tissues was greater. In the severest cases of B deficiency, the symptoms resembled those of NH_3 poisoning, suggesting an internal accumulation of NH_3 from protein decompn. consequent upon lack of carbohydrates, but the previous conclusions as to the mechanism of action of B and lack of direct connection between B and these phenomena are unchanged. Six references. C. J. Schollenberger

The influence of boron with various potash-nitrogen ratios on the growth of field beans. B. Arenz and W. Schropp. *Bodenkunde u. Pflanzenernähr.* **16**, 191–205 (1940).—*Vicia faba*, plants grown in vessels contg. 18 kg. Hohenbocka glass-sand, fertilized with 0.0 and 0.5 g. N as $NaNO_3$, 1.0 g. P_2O_5 as $CaHPO_4$, 1.0, 2.0 and 3.0 g. K_2O as K_2SO_4, 0.0 and 1.0 mg. B as H_3BO_3, with rain water to 40–80% holding capacity, were harvested after 12 weeks' growth. Dry-matter production was significantly increased, nodulation and percentage total and protein N were decreased by $NaNO_3$, although abs. crude and pure protein production were increased, especially with increased K_2O. pH of root and nodule sap was increased by $NaNO_3$, further by K_2SO_4. Without B, increase in K_2O supplied decreased dry-matter production, especially with N in addn. In the latter case, nodulation was strongly depressed with increasing K_2O, although without N it increased with K_2O supplied. With B and without N, dry matter production varied inversely, nodulation varied directly, and with both B and N, yields and percentage total and protein N increased with K_2O fertilization. Without both B and N, the latter relations were inverted. With increasing K_2O, pH of sap generally increased; it varied 5.4–5.7 in stems, 5.7–6.9 in roots, 5.1–6.0 in nodules. With few exceptions, B greatly increased dry-matter production, and nodulation still more. B seemed to further utilization of N supplied by nodules and of increased K_2O as fertilizer; the effect is attributed to improved water economy and translocation, and general vitality of the plants as well. The ratio protein:sol. N was not affected by B. Plants grown without B showed great variation in the appearance of deficiency symptoms, indicating either differences in natural resistance or varying stocks of B in the seed. Eight references. C. J. S.

Chemical investigations of sugar sorgo. Ezio Emiliani. *Ricerca sci.* **10**, 1131–6(1939); cf. *C. A.* **33**, 6079[6].—Carbohydrates found in sorgo juice include sucrose, glucose, fructose, starch, pectins and "gum." The sugars are more abundant in the middle internodes, decreasing toward bottom and top; in this part the ratio of reducing sugars to sucrose is lowest. Glucose is always in excess of fructose. In nearly all varieties the middle internodes contain most of the starch. Among products of hydrolysis of the alc.-insol. "gum" left after fermenting the juice were identified xylose, glucose, rhamnose and a uronic acid, probably glucuronic acid. O. W. Willcox

Influence of artificial fertilizers on photosynthetic efficiency of *Andropogon sorghum* (Singh, *et al.*) **15**. Alkaloids of papaveraceous plants (Manske) **17**.

PHILIP B. HAWK

Rapidity of the appearance of vitamin A deficiency in chicks. Madeleine Vermès, G. Lisot, Paul Meunier and Yves Raoul. *Compt. rend. acad. agr. France* **25**, 1090–2 (1939).—The natural reserves of vitamin A of the egg yolk and liver of chicks are small. All trace of vitamin A disappears from the liver by the end of the 8th day. Ingestion or injection of large doses of vitamin A does not build up large reserves. Chicks should receive the vitamin in frequent small doses. J. R. Adams

Vitamin C in athletic exercise. Hermann Brandt and William Schusselé. *Compt. rend. soc. phys. hist. nat. Genève* **55**, 102–8 (in *Arch. sci. phys. nat.* **20**, Nov.-Dec., 1938).—Muscular effort in some cases increases, and in others decreases, the reducing power of the urine, the direction of the change being const. for the same subject. B. C. P. A.

Factor W and its relation to vitamin B complex. D. V. Frost and C. A. Elvehjem. *J. Biol. Chem.* **128**, 23–34 (1939); cf. *C. A.* **32**, 981[8].—Factor *W* is weakly acidic, sol. in phenol and aniline, and insol. in ether. No appreciable proportion of the activity is pptd. from fuller's earth filtrates by $AgNO_3$, Pb acetate, picric acid, $HgCl_2$ or H_2PtCl_6. Factor *W* is distinct from vitamin B_6, the chick antidermatitis factor, and nicotinic acid. It is equally well adsorbed at pH 1 or 6 on C, from which it can be eluted by org. solvents. B. C. P. A.

Vitamin B_1 metabolism in health and disease. H. Schroeder and L. Benacchio. *Klin. Wochschr.* **18**, 148–50 (1939).—The normal excretion of vitamin B_1 in the urine is 100–400 γ per day; in various diseases only 0–100 γ was excreted. After intravenous injection of 5–10 mg. of aneurin normal excretion rises to 3–9 mg.; in most diseases the value was less than 3 mg. Gastric juice has no influence on vitamin B_1, but traces of hemin destroy most of it. Excessive intake of carbohydrates in addn. to an ordinary diet stops vitamin B_1 excretion. B. C. P. A.

The control of alimentary and medicinal vitamins in Poland. R. Truszkowski. *Bull. office intern. hyg. pub.* **30**, 2280–5(1938). Ruth Berggren

The progress of work on nutrition in India. W. R. Aykroyd. *Bull. office intern. hyg. pub.* **30**, 2328–32(1938). Ruth Berggren

Attempt at preventive vitaminization. Georges Mouriquand, Maurice Dauvergne and Violette Edel. *Compt. rend.* **209**, 1023–4(1939).—The ascorbic acid content of the adrenal glands of normal guinea pigs did not increase after the daily oral administration of 50 mg. ascorbic acid for 15 days in addn. to the regular diet. When placed on a scorbutogenic diet, the guinea pigs which had been given this extra ascorbic acid showed no greater resistance to scurvy than those which had not. The addn. of vitamin C to a diet which already contains adequate amts. of vitamin C is apparently not indicated therapeutically. Ruth Berggren

The effect of feeding on the constants of butter fat and the quality of butter. Fr. Kieferle. *Vorratspflege u. Lebensmittelforsch.* **1**, 376–81(1938); *Dairy Sci. Abstracts* **1**, No. 1, 10. C. L. B.

The ascorbic acid content of human milk in summer and winter. H. Winkler and E. Heins. *Z. Geburtsh. Gynäk.* **117**, 148–64(1938); *Dairy Sci. Abstracts* **1**, No. 1, 92–3 (1939).—The measurements covered late pregnancy and the first ten days *post partum*. There was a steady rise in the vitamin C level from colostrum (av. in winter 2.5 mg./100 ml., in summer 3.3 mg.) to true milk which reached after the fourth day a steady level at 4.1 mg./100 ml. in winter and 5.7 mg. in summer. C. L. B.

"Swayback" studies in North Derbyshire. I. The feeding of copper to pregnant ewes in the control of "swayback." G. Dunlop, J. R. M. Innes, G. D. Shearer and H. E. Wells. *J. Comp. Path. Therap.* **52**, 259–65(1939); cf. *C. A.* **33**, 8702[8].—The administration to pregnant ewes of Cu contained in salt licks has a remarkably beneficial effect on the prevention of "swayback" in the progeny. The Cu requirement is max. when cerebral myelination is active in the lamb. Rachel Brown

Vitamin C and peptic activity. E. Tria. *Atti accad. Lincei, Classe sci. fis., mat. nat.* **29**, 632–4(1939).—The action of vitamin C on pepsin was studied by the method of Northrop, with casein in the substrate. There is a definite increase in enzyme activity amounting to 10–25%. In order to det. whether the effect was due to any change in oxidation-reduction potential, a duplicate test was made with *cystine*-HCl; it is known to affect this potential. No change was noted. Thus the activation is due to the vitamin present. A. W. Contieri

More recent development of vitamin investigation. K. Brunner. *Pharm. Zentralhalle* **80**, 725–30, 737–41, 749–53(1939).—A review. W. O. E.

Role of vitamins in chemical metabolism. Oskar Bauer. *Pharm. Zentralhalle* **81**, 13–18, 27–9(1940).—An address, with 10 references. W. O. E.

Protein levels of rations for White Leghorn pullets. A. E. Tomhave. *Delaware Agr. Expt. Sta., Bull.* **219**, 57 pp.(1939); cf. *C. A.* **34**, 2035[3].—For best results in growing White Leghorn pullets, the growing ration should contain 18% protein for the 1st 8–12 weeks, and 16% protein from 8 to 12 weeks of age until the laying ration is fed. The protein required to produce a lb. of gain is in direct proportion to the level of protein fed in the growing ration. The protein level fed during the growing period has but little influence on the no. of eggs produced during the 1st year of production. C. R. Fellers

Chronic selenium poisoning of rats as influenced by dietary protein. Ross A. Gortner, Jr. *J. Nutrition* **19**, 105–12(1940).—Diets contg. 30% casein exerted marked protective action against the toxic effect of Se in rats. Lactalbumin is only slightly less protective than casein. Edestin and gelatin, when fed at high levels in seleniferous diets, exerted no detoxifying action. The toxic effect of as much as 35 p. p. m. of Se in the diet was neutralized by the use of casein or lactalbumin (cf. Smith, *C. A.* **33**, 8715[6]). C. R. Fellers

Comparison of the utilization by guinea pigs of equivalent amounts of ascorbic acid (vitamin C) in lemon juice and in the crystalline form. E. Neige Todhunter, R. C. Robbins, G. Ivey and W. Brewer. *J. Nutrition* **19**, 113–19 (1940).—Pure ascorbic acid and lemon juice contg. equiv. amts. of ascorbic acid had comparable scurvy-preventing effects in guinea pigs. The lemon juice produced fewer hemorrhages than the equiv. amt. of ascorbic acid. C. R. Fellers

Comparison of the utilization by college women of equivalent amounts of ascorbic acid (vitamin C) in red raspberries and in crystalline form. E. Neige Todhunter and Alva S. Fatzer. *J. Nutrition* **19**, 121–30(1940).—The ascorbic acid present in red raspberries was as efficiently utilized as pure ascorbic acid. Results were based on urinary excretion and blood-plasma levels after administration of ascorbic acid from both sources. C. R. F.

The amount of ascorbic acid required to maintain tissue saturation in normal adults. E. Neige Todhunter and Ruth C. Robbins. *J. Nutrition* **19**, 263–70(1940).—The requirement for 3 adults averaged about 1.65 mg. per kg. wt. per day. Urinary excretion, even under controlled conditions, was far from const. Values above 1 mg. of ascorbic acid per 100 ml. of blood plasma were obtained when the total intake was 60 mg. C. R. Fellers

Metabolism of tyrosine, aspartic acid and asparagine, with special reference to respiratory exchange and heat production. Max Kriss and Lawson F. Marcy. *J. Nutrition* **19**, 297–309(1940); cf. *C. A.* **33**, 6411[8].—Tyrosine, aspartic acid and asparagine fed to rats as supplements to a mixed maintenance ration, in quantities supplying 7.5, 5.8 and 6.0 kg. cal. per day, resp., appeared to be absorbed to the extent of 97%, 95% and 97%. The balances of N indicated that of the total N ingested as aspartic acid and as asparagine 25.1% and 13.7%, resp., were retained in the body, and that none of the tyrosine was retained. The C:N ratios of the urinary constituents from the different supplements were: from tyrosine 2.77:1, from

aspartic acid 0.50:1, and from asparagine 0.45:1. The calcd. fractions of the urinary N representing metabolized amino acids were approx., for tyrosine 65%, for aspartic acid 97%, and for asparagine 98%. The metabolizable energy values of tyrosine, aspartic acid and asparagine (corrected to a basis of N equil.) were 59.2%, 71.8% and 60.6%, resp., of the gross energy of the amino acids. The values obtained for O_2, CO_2 and cal. per g. of urinary N are approx. twice as great for aspartic acid as the corresponding values for asparagine. C. R. Fellers

Carotenoid pigments: occurrence, properties, methods of determination, and metabolism by the hen. W. J. Peterson, J. S. Hughes and L. F. Payne. *Kansas Agr. Expt. Sta., Tech. Bull.* **46**, 3–74(1939).—A comprehensive review of the subject with 164 references. C. R. Fellers

Utilization of food elements by growing chicks. VIII. Comparison of alfalfa meal and artificially dried Sudan grass meal in a ration for growing chicks. C. W. Ackerson, M. J. Blish and F. E. Musschl. *Nebraska Agr. Expt. Sta., Research Bull.* **116**, 2–7(1939); cf. *C. A.* **33**, 9376[8].—Consumption was approx. the same in the feeding trial and there were no significant differences in growth rate or chem. compn. of the chicks after 6 weeks. C. R. Fellers

Effect of sulfur dioxide on the nutritive value of alfalfa hay. J. K. Loosli, B. L. Richards, Jr., L. A. Maynard and L. M. Massey. *N. Y. (Cornell) Agr. Expt. Sta., Mem.* **227**, 39 pp.(1939).—Hay grown in the area subject to smelter fumes and intermittently exposed to SO_2 concns. which ranged from traces to 0.42 p. p. m. served as sole diet for rabbits from weaning through reproduction and lactation. It produced as satisfactory results as were obtained with a hay grown under similar conditions outside the smelter fume area. Similar results were obtained with guinea pigs. Digestion coeffs. for both hays with rabbits and lambs were similar. Hays fumigated in cabinets where the gas concns. varied from 0.15 to 1.10 p. p. m. were also fed to the lab. animals without ill effects. The increase in S content of the alfalfa was nearly all in inorg. S. There was some increased body retention of S from the sulfured hays. The field samples of hay which were exposed to SO_2 fumes, as well as the artificially fumigated hays, showed the same carotene and vitamin A contents as controls. High exptl. doses of the gas which resulted in extensive burning of the leaves adversely affected the carotene content. C. R. Fellers

Methods of feeding laying hens. E. I. Robertson, J. S. Carver and J. W. Cook. *Wash. Agr. Expt. Sta., Bull.* **381**, 5–15(1939).—Five methods of feeding were compared. Nutritional. C. R. Fellers

Protein requirements of White Leghorn pullets. J. S. Carver, V. Heiman, J. W. Cook and J. L. St. John. *Wash. Agr. Expt. Sta., Bull.* **383**, 5–30(1939); cf. *C. A.* **30**, 2237[9], 3862[6].—A 17% protein level maintained a satisfactory growth up to 6 weeks of age; 15% level from 7 to 12 weeks, and 13% from 13 to 22 weeks. The birds fed a 19% protein ration showed no improvement over the 17%. Protein requirements decrease with increasing age of chicks. Up to 12 weeks of age the pullets in all groups required about the same no. of units of feed to produce a unit of gain. The greatest efficiency in utilizing protein was during the 1st 6 weeks. There was better utilization of protein at the lower levels. The level of protein fed did not affect the av. gain in wt. or final body wts. of the birds during the laying period. Similarly, there was no effect on egg production. Sexual maturity was attained a few days earlier on the high-protein levels. C. R. Fellers

Rickets and similar bone diseases. IV. Comparative experiments with swine on various feeds. József Marek, Oszkár Wellmann and László Urbányi. *Állatorvosi Lapok* **63**, 1–3, 8–9(1940); cf. *C. A.* **34**, 1053[9].—Rickets can occur in swine as a result of (1) insufficient Ca or P salts or (2) a one-sided lime-rich or phosphorus-rich diet. The lowest normal values for each 10 kg. live wt. of swine are 5.7354 g. Ca and 4.2340 g. P_2O_5 with an excess of alk. earth of 25 mg. Various types of pigs showed different susceptibilities to rickets. Feeds low in Ca and P decreased the P_2O_5 content of the ash of bones significantly; feeds high in Ca and P increased the P_2O_5 of the bone ash. Excess of Mg caused an increase in the content of Mg and P_2O_5 only in simultaneous Ca deficiency and with a proper dosage of P. Ca deficiency caused an increase of inorg. P in the blood serum; excess Ca diminished the inorg. P content of the serum. Excess Mg seemed to increase slightly the Mg content of the serum. VI. **Effect of the mineral salt ratio and of the vitamin D content of the feed on the utilization of mineral substances in the organism.** *Mezögazdasági Kutatások* **12**, 251–62(1939).—Feeding expts. were made on 27 swine for 6 days. Various Ca and P salts and vitamin D were added to the feed; in some expts. vitamin D was injected. The Ca/P quotient of the feces was the reverse of that of the feed. Most suitable are feed mixts. that have an excess of alk. earth of 5–25 mg. An unfavorable ratio of Ca/P in the feed is only slightly affected by vitamin D. The antirachitic effect of vitamin D is attributed to the control of metabolism and the acceleration of the resorption of nutritive salts. S. S. de F.

Production of prothrombin deficiency and response to vitamins A, D and K. Margaret C. Elliott, Bertha Isaacs and A. C. Iyy. *Proc. Soc. Exptl. Biol. Med.* **43**, 240–5(1940).—Prothrombin deficiency was produced in rats by feeding an adequate diet contg. 20% by wt. of mineral oil. Subcutaneous injections of vitamin K corrected the deficiency, activated ergosterol partially corrected it, while vitamin A had no effect. A method of detg. prothrombin time in rats is described in detail. L. E. Gilson

Bacteriological control of vitamin C. A. S. Dantsiger. *Lab. Prakt.* (U. S. S. R.) **14**, No. 9–10, 2–3(1939).—The colonies were counted after a 48-hr. incubation in the thermostat on 1% sugar agar-agar with a dilu. of from 0.01 to 0.0001 cc. The coli titer was detd. by the usual method on Endo's medium in dilns. of from 10.0 to 0.01 cc. The yeast was cultivated on ordinary agar-agar (pH = 7.4) with 0.25% of glucose at 26–8°. The growth was observed after 5–7 day in the dark. The colonies were grayish white or yellowish. A potato medium was used for the inoculation of molds. Add 1 l. of distd. water to 200 g. of skinned potatoes, boil for 1 hr., pass through a double paper filter, add glucose 20 g. and "Arkhangelsk" agar-agar 30 g. and sterilize in Koch's app. for 30 min. An acid reaction is necessary (pH = 5.6). The vitamin C concentrate was artificially contaminated with cultures of the typhus and the paratyphus rods. After standing for 3 days in the dark in a thermostat the vitamin gave no growth of the typhus-paratyphus group. W. R. Henn

Determination of vitamin B_1 with Phycomyces blakesleeanus. T. Ya. Paleĭ. *Lab. Prakt.* (U. S. S. R.) **14**, No. 9–10, 4–5(1939).—The investigation was based on the fact that *Phycomyces* does not grow in avitaminized media without addns. of vitamin B_1. The synthetic culture medium was prepd. by adding to 100 cc. of distd. water glucose 10%, asparagine 0.1%, KH_2PO_4 0.05% and $MgSO_4$ 0.05%. Incubate the cultures in a thermostat at 25–8° for 10–12 days, boil the cultures, remove the films, wash with water and alc. and dry to const. wt. at 37–45° for 2–3 days. The activity of the vitamin B_1 prepn. was detd. from the wt. of the *Phycomyces* films. Usually the wt. of the mycelium obtained in a synthetic medium was 3–15 mg. From an addn. of cryst. vitamin B_1 or of an active prepn. of vitamin B_1 the wt. increased to 70–90 mg. *Phycomyces* is 20–100 times as sensitive to the action of vitamin B_1 as are pigeons or rats. Addn. of only 0.15–1.0 γ of the vitamin causes a considerable growth. The results obtained from the action of vitamin B_1 prepns. on *Phycomyces* agreed with the biol. expts. on pigeons. Minute amts. of vitamin B_1 can be detected by means of *Phycomyces* that cannot be detected by expts. on animals. The deſn. of vitamin B_1 in cooked fruits, vegetables, etc., is doubtful since the exts. of these substances have different mineral compns., and the changing amts. of org. acids can affect the development of *Phycomyces*. W. R. Henn

Effect on the blood of the administration of thiamine chloride (vitamin B_1). David L. Farley. *Bull. Ayer Clin. Lab. Penna. Hosp.* **3**, 335–8(1939).—When thiamine chloride is administered to rabbits by mouth or hypo-

dermically a remarkable increase occurs in the power of their serum to inhibit hemolysis by digitonin. Solns. of thiamine chloride in serum or in 0.85% NaCl soln. lack this inhibitory power. Apparently thiamine stimulates the production in the rabbit of an inhibitory substance which is a cocarboxylase. A further increase in this inhibitory power of the serum of thiamine-treated rabbits follows the administration of typhoid vaccine. J. S. H.

Estimation of the inhibitory power of serum against saponin hemolysis as a possible guide in the administration of vitamin B_1. David L. Farley. *Bull. Ayer Clin. Lab. Penna. Hosp.* 3, 339–43(1939); cf. *C. A.* 34, 2445[8].—In 1 normal and 6 diseased persons, administration of thiamine chloride or yeast increased the antihemolytic power of their blood serum toward digitonin. It is suggested that detns. of the inhibitory or antihemolytic power of the serum may establish an index of the effective therapeutic level of the substance produced by administration of thiamine. Joseph S. Hepburn

Relative toxicity of sodium fluoride in a dry diet, in milk and in water. Cecelia Schuck. *J. Dental Research* 18, 491–6(1939).—The exptl. animals were albino rats. When 0.05% NaF was used in the water, most of the rats died in 2 weeks; the same concn. in milk markedly depressed the rate of growth, and, in a dry ration, produced a lesser depression of that rate. Dental signs of fluorosis appeared in all 3 groups, but developed earliest in the surviving rats which received NaF in water. 11 references. Joseph S. Hepburn

Animal experimental investigations concerning the influence of the vitamin preparation Tetravitol upon the vitamin C metabolism and the bactericidal power of the blood. Gertrud Brühl. *Z. Vitaminforsch.* 9, 297–308 (1939).—Addn. of vitamins A, B_1–B_6, C and D, in the form of unboiled Tetravitol, to the deficient ration of rabbits for a period of 19 days produced increases in body wt., the bactericidal power of the blood, and the excretion of vitamin C in the urine. Addn. of boiled Tetravitol to the deficient ration gave rise to a distinct decrease in body wt., and in the vitamin C content of the urine, and did not influence the bactericidal power of the blood. 40 references. Joseph S. Hepburn

Excretion, absorption and storage of ascorbic acid in guinea pigs. Ole Jacob Broch. *Z. Vitaminforsch.* 9, 309–25(1939).—The ascorbic acid content of the adrenal capsule, spleen and intestine depends upon the amt. ingested, but does not exceed a max. even if massive doses be given. The reducing power of the urine is not appreciably affected by ingestion of large doses, but is affected definitely by injected doses. Small doses have the same effect, regardless of the mode of administration. In guinea pigs infected with tuberculosis, the consumption of ascorbic acid is normal during the period of incubation, but increases with the development and severity of the clinical symptoms. 43 references. Joseph S. Hepburn

Experimental vitamin A deficiency in man. Wolf v. Drigalski. *Z. Vitaminforsch.* 9, 325–30(1939).—A vitamin A-deficient diet was used for 72 days, and adaptometric tests were made. Subnormal dark adaption did not necessarily indicate vitamin A deficiency, but normal dark adaption occurred only when the supply of vitamin A was adequate. 10 references. Joseph S. Hepburn

Does citrin (vitamin P) occur in milk? W. Neuweiler. *Z. Vitaminforsch.* 9, 338–42(1939).—Citrin (eriodictyol) was not detected in human milk or cow milk. It was not secreted in human milk even when 50 mg. was administered intravenously daily for 6 days. It was not appreciably retained by healthy women in the puerperium. Citrin is not a supplement to, or activator of, ascorbic acid. Joseph S. Hepburn

Ascorbic acid in the cell and its influence upon cellular activity. E. Tonutti. *Z. Vitaminforsch.* 9, 349–64(1939). —A review. 14 references. Joseph S. Hepburn

Availability of manganese in natural and precipitated manganese carbonate [for prevention of perosis in chickens]. Selma L. Bandemer, J. A. Davidson and P. J. Schaible. *Poultry Sci.* 19, 116–25(1940).—Rhodochrosite failed to prevent perosis, but pptd. $MnCO_3$ protected against it. The latter prevented perosis at a level of 30 p. p. m. Mn in the ration, whereas 300-mesh rhodochrosite was unsatisfactory at 125 p. p. m. Rhodochrosite, either roasted or dissolved in acid, and pptd. $MnCO_3$ with addns. of known impurities of the ore, were effective. Excess, in the ration, of certain mineral supplements, such as $Ca_3(PO_4)_2$, which are known to be perosis-producing, decreased the soly. of both carbonates in 0.1 *N* HCl, but the reduction was more pronounced with the ore. If both carbonates were in soln. this effect was less, with no distinction between the 2. The sol. Mn did not seem to be correlated with the pH of the ext. Methods for the *detn. of Mn* and the *differentiation of rhodochrosite from pptd. $MnCO_3$* are given. K. D. Jacob

The effect of a riboflavin deficiency in the hen upon embryonic development of the chick. R. W. Engel, P. H. Phillips and James G. Halpin. *Poultry Sci.* 19, 135–42 (1940).—Hens fed a diet low in riboflavin (I) produced fewer eggs and eggs of lower hatchability than did hens fed the same diet supplemented with 400 γ per 100 g. of ration (II). Myelin sheath degeneration occurred in the sciatic nerve in about 60% of the surviving embryos obtained from eggs produced by hens on I and less than 10% with hens on II. Fertile eggs which were laid by riboflavin-deficient hens and which consistently failed to develop beyond the 1st week of incubation produced normal embryos if injected with 50 γ riboflavin on the 1st day of incubation. Hens kept on I for 7 months and producing eggs of very low hatchability could be restored to the production of eggs of normal hatchability by daily oral doses of 50 γ of addnl. riboflavin. Hens kept on I produced eggs with lowered riboflavin content in the albumin, which could be increased by daily oral administration of riboflavin. The riboflavin content necessary in fertile eggs for the development of normal embryos was 2.5–3.0 γ per g. of albumin. Developing embryos from hens kept on I stored less riboflavin in their livers than did those from hens kept on II. K. D. Jacob

Mineral research in animal nutrition. V. R. Berliner, E. W. Sheets and J. S. Moore. *Proc. Assoc. Southern Agr. Workers* 40, 70–1(1939).—Based on over 1000 blood analyses of beef and dairy cattle, it appears that in most sections of Mississippi the forage Ca is sufficient to maintain the serum Ca at a normal level only in spring and fall during the growth season of pasture legumes, whereas in other seasons of the yr. the serum Ca is slightly below normal (9–11 mg. Ca per 100 ml. serum, instead of the normal level of 11–13 mg.). K. D. Jacob

Hypermagnesemia without critical symptoms in dairy cattle. M. W. Eveleth, D. F. Eveleth and F. E. Walsh. *J. Dairy Sci.* 23, 85–9(1940).—An increase in the level of serum Mg of dairy cattle was found which was apparently due to drought conditions affecting the pasture. There appeared to be no clinical symptoms assocd. with a temporary hypermagnesemia in cattle. The level of Mg in the blood stream is influenced by many factors, most of which are of dietary origin. A. H. Johnson

Comparative physiological responses of dairy calves fed rations having different levels of milk proteins. G. H. Wise, W. E. Petersen and T. W. Gullickson. *J. Dairy Sci.* 23, 91–102(1940).—The responses of 2 major groups of milk-fed calves, one receiving a ration of normal nutritive ratio, and the other a narrow nutritive ratio were compared. All the calves regardless of the supplements possessed a depraved and erratic appetite. The consumption of abnormally large amts. of casein by calves did not adversely affect growth or general appearance but induced lethargy and occasionally digestive disturbances. The most pronounced differences observed in the blood constituents of the 2 groups were in the plasma N, which was high in the calves receiving the protein-supplemental ration and comparatively low in the sugar-supplemented ration. The results did not substantiate the postulate that milk proteins constitute the principal etiological factor in the disturbance of the mineral metabolism of milk-fed calves. A. H. Johnson

Carotene and vitamin A in the nutrition of growing dairy cattle. R. E. Ward, S. I. Bechdel and N. B. Guerrant.

J. Dairy Sci. **23**, 115–24(1940).—The data show that the requirement of growing dairy calves is 11 γ per day per lb. of body weight. This level of carotene intake was sufficient to maintain growth and to prevent the usual vitamin A-deficiency symptoms. The adequacy of this amt. of carotene, however, depends on the source of supply. While it appears desirable that the carotene intake should be consistently above the min., it was not found that such excess resulted in any marked improvement in the growth rate. The availability of the carotene to calves from the various sources studied was: carotene concentrate, alfalfa hay, corn silage, corn meal, timothy hay and alfalfa-molasses silage. A. H. Johnson

The comparative nutritive values of butterfat and certain vegetable oils. E. J. Schantz, C. A. Elvehjem and E. B. Hart. *J. Dairy Sci.* **23**, 181–9(1940).—Good growth was obtained in rats on a diet of 4% butterfat, corn oil, coconut oil, cottonseed oil or soybean oil homogenized into mineralized skimmed milk. Sufficient amts. of all the known vitamins were supplied to each diet. Rats on butterfat, however, made better and more efficient gains during the first 2 or 3 weeks on the expt. than rats on vegetable oils homogenized into skimmed milk. The growth-stimulating property of butterfat appeared to lie in the saponifiable fraction since feeding the nonsaponifiable fraction along with corn oil or coconut oil did not give the same response as was obtained with butterfat. Rats raised on butterfat milk had a much smoother appearing coat of hair throughout the expt. than rats raised on vegetable oil milks. It appears that the kind of fat in the diet is important in the nutrition of the young growing animal. A. H. Johnson

The substitution of fats in the Sherman-Spohn basal diet. V. V. Efremov and E. M. Maslenikova. *Voprosy Pitaniya* **8**, No. 4, 40–3(in English, 43)(1939).—The substitution of sunflower oil for butter in the Sherman-Spohn basal diet gives a uniform av. curve of weekly gain in wt. in animals without showing harmful effects. S. A. K.

Importance of economical milk in human nutrition. Marietta Eichelberger. *Am. J. Pub. Health* **30**, 169–74 (1940).—Thirty-five references. J. A. Kennedy

Vitamin K activity of some naphthoquinones and derivatives. (Preliminary). Bertil Sjögren. *Z. physiol. Chem.* **262**, I–III(1939).—The vitamin K activity of 2-methyl-1,4-naphthoquinone is 30–35 × 10^6 Dam units per g. Of the hydroquinone it is practically the same, while the diacetate of the hydroquinone has 20 × 10^6 units per g. 2-Ethyl-1,4-naphthoquinone is much less active. M. L.

Effect of vitamin B_1 on the adrenaline contents of adrenals and of blood. Elisabeth Sárfy. *Z. physiol. Chem.* **262**, 87–94(1939).—The figures given after the nature of the exptl. animals are, resp., the no. of animals, the av. adrenaline content of the adrenals in mg./g., the range, the av. adrenaline contents of the blood in γ%, the range. Normal pigeons (spring) 11, 2.29, 1.70–2.86, 6.62, 5.66–8.42; after 2 weeks on a vitamin B_1-free diet 4, 2.78, 2.56–3.27, 4.97, 4.22–6.48; terminal beriberi 8, 1.30, 0.98–1.85, 10.84 (4 animals only), 9.47–14.66; normal (autumn) 3, 1.57, 1.35–1.76, 6.71 (1 animal only); 5 days on 1 mg. B_1 per day 3, 0.90, 0.71–1.26, 10.73, 10.41–11.05 (2 animals); 10 days on same 3, 1.79, 1.38–2.49, 11.99, 10.13–13.84; 15 days on same 3, 1.56, 1.32–1.75, 9.37, 8.87–9.73; normal rats 8, 1.88, 1.54–2.34, —, —; 14 days on a vitamin B_1-free diet 3, 2.92, 2.80–3.04, —, —; 3 weeks vitamin B_1-free diet 3, 3.12, 2.95–3.31, —, —; 4 weeks 2, 1.26, 1.10–1.42, —, —; terminal beriberi 5, 0.90, 0.57–0.94, —, —. The conclusion is a qual. restatement of the behavior of the averages. Milton Levy

The glycogen contents of the livers of B_1-avitaminotic rats. Vilma Sz. Hermann. *Z. physiol. Chem.* **262**, 95–102 (1939).—After the exptl. periods, rats were fasted 12 hrs., given 1 g. fructose per 100 g. and after 7 hrs. killed. The glycogen contents of the livers of normal rats on a B_1-free diet to which 5 mg. of B_1 was given daily by injection showed (averages of 3 rats each) 4% glycogen after 10 days, 3.1% after 20 days, and 6.9% after 40 days; when 1 mg. of B_1 was given, the corresponding figures were 5.0%, 3.5% and 4.0%. Avitaminotic rats after 2 weeks showed 3.6%, 3 weeks 5.0%, 4 weeks 3.0%, 5 weeks 2.9% and 6 weeks 2.1%. The distribution of figures in the 5- and 6-week rats show about equal nos. of normal and very low values, the latter probably represent an inanition symptom. The increase at the 3-week period is considered significant. From 4 to 7 rats are included in each average. Milton Levy

Mineral metabolism of rats on an extremely sodium-deficient diet. Elsa Orent-Keiles and E. V. McCollum. *J. Biol. Chem.* **133**, 75–81(1940); cf. *C. A.* **31**, 6299[9].—Young rats were fed a diet contg. 0.002% Na and their metabolism was studied over a 19-week period at 7-day intervals. There was a continuous neg. Na balance accompanied by a striking retention of K and some increase in Mg. The Ca, P and Cl metabolism was apparently unaffected. The N retention was pos. although it progressively decreased until the 14th week after which time it became neg. simultaneously with the extreme pathol. changes of the eyes and the onset of rapid wt. loss. The delicate mechanism in the organism regulating the osmotic pressure and acid-base balance was not appreciably disturbed since the Na-depleted animal was sufficiently compensated by the increased retention in K and Mg for neutralization of the metabolic acids excreted in the urine despite the unbalance in the diet between base and acid. A. P. Lothrop

The vitamin K activity of 4-amino-2-methyl-1-naphthol and 4-amino-3-methyl-1-naphthol. A. D. Emmett, Oliver Kamm and E. A. Sharp. *J. Biol. Chem.* **133**, 285–6 (1940).—4-Amino-2-methyl- and 4-amino-3-methyl-1-naphthol as hydrochlorides are readily sol. in H_2O or saline soln. and can be given either orally or parenterally. The 2-methyl compd. is almost 3 times as potent as vitamin K_1 and has given excellent clinical results. Daily doses ranging from 3600 to 7200 curative chick units given intravenously restored to normal severe prothrombin deficiency of obstructive jaundice within 2–3 days, and infants have responded within 12 hrs. to a dosage of 1800 units. A. P. Lothrop

The composition of the diet of the Chinese in Batavia. L. W. J. Holleman, D. R. Koolhaas and J. A. Nijholt. *Mededeel. Dienst Volksgezondheid Nederland.-Indië* **28**, 306–20(1939).—Qual. descriptions, frequency of occurrence and chem. analyses of Chinese foods in Batavia are given. The relatively greater amt. of cholesterol in the food is suggested as a clue to the higher incidence of carcinoma of the stomach in Chinese than in Japanese. Janet McAfee

The dark-adaptation test: its reliability as a test for vitamin A deficiency. Leslie J. Harris and M. A. Abbasy. *Lancet* **1939, II**, 1299–1305, 1355–9; cf. *C. A.* **32**, 4636[8].—Improvements in the app. and technique are described. Results of tests on children from various social classes show that lowered dark-adaptation is assocd. with dietary deficiency in vitamin A. Deficiencies seem to be less common in adults than in children. While the theoretical basis of the test is reliable, the test is capable of detecting deficiency, but not of assessing different levels of normality. E. R. Main

Prothrombin and vitamin K therapy. John D. Stewart and G. Margaret Rourke. *New Engl. J. Med.* **221**, 403–7 (1939); cf. *C. A.* **34**, 1055[3].—The prothrombin content of the blood may be greatly reduced in obstructive jaundice and is rapidly restored to the normal level after oral administration of a vitamin K-cholic acid mixt. No decrease in prothrombin is observed in hemophilia, aplastic anemia and thrombocytopenic purpura. Decreases may occur in chronic ulcerative colitis, malnutrition and cachexia, but further study is needed to det. the value of vitamin K therapy in these conditions. The method of Warner, Brinkhous and Smith for detg. prothrombin (*C. A.* **30**, 4191[5]) is discussed. E. R. Main

Pigment excretion in pellagra. Arnold P. Meiklejohn and Robert Kark. *New Engl. J. Med.* **221**, 519–21(1939). —Urine specimens from patients with endemic pellagra gave a pos. Jaffe test for indican without the addn. of the oxidizing agent. After removal of the indigo with $CHCl_3$, a red pigment could be extd. with AmOH (cf. Watson, *C. A.* **33**, 8712[5]). A pos. reaction to the test of Beckh,

Ellinger and Spies (*C. A.* **31**, 7519[7]) appears to be due to pigments capable of producing the urorosein reaction rather than to porphyrin-like substances. E. R. Main

Riboflavin deficiency in man. Norman Jolliffe, Harry D. Fein and Louis A. Rosenblum. *New Engl. J. Med.* **221**, 921–6(1939).—Lesions are described which are similar to, though more advanced than, those produced experimentally by riboflavin deficiency (cf. Sebrell and Butler, *C. A.* **32**, 2187[6]). The lesions are improved after administration of natural or synthetic riboflavin, but fail to respond to administration of nicotinic acid or use of diets inadequate in vitamin B complex. E. R. Main

The treatment of hypoprothrombinemia with synthetic vitamin K_1. Report of two cases. Howard A. Frank, Alfred Hurwitz and Arnold M. Seligman. *New Engl. J. Med.* **221**, 975–7(1939).—Synthetic vitamin K_1 (cf. Fieser, *C. A.* **33**, 8602[2]), given intravenously in a dose of 10 mg. to patients with obstructive jaundice, reduced the clotting time to a normal level within 4 hrs. The method of prepg. the compd. for intravenous injection is described. No untoward reactions were noted after oral or intravenous administration to human subjects or to animals. E. R. M.

The vitamins. Arnold P. Meiklejohn. *New Engl. J. Med.* **222**, 313–18(1940); cf. *C. A.* **33**, 5039[2].—A review of recent research, with 44 references. E. R. Main

Avitaminosis B_1 and cardiac insufficiency. Alcoholic myocardium damage representing a case of beriberi. L. Langeron. *Presse méd.* **47**, 1189–91(1939). A. E. Meyer

Ascorbic acid therapy in infancy. Javier R. Mendilaharzu and Eduardo L. Zavala Rodriguez. *Semana méd.* (Buenos Aires) **1940, I**, 365–77.—During the first 12 months of life the infant is able to synthesize ascorbic acid. The 1 to 1.5 mg. daily necessary are amply supplied in the maternal milk. The requirements are increased in infections and gastric disturbances. Favorable results obtained with intravenous injections of ascorbic acid in a variety of diseases are reported. A. E. Meyer

The influence of combined lime-vitamin D therapy on growth and tooth formation. U. Rheinwald. *Deut. zahnärztl. Wochschr.* **41**, 535–7(1938); *Chem. Zentr.* **1938, II**, 3418.—Supplementary feeding of Ca (Calipot) to guinea pigs receiving a normal diet had no effect on growth and tooth formation. When Ca and vitamin D (Calipot "D," contg. also irradiated yeast) were added to the diet the final wt. of the animals was greater and was attained in $^3/_4$ the time required for the controls. In addn., the upper and lower incisors reached their normal length in $^2/_3$ the time required for the controls. The blood Ca was also higher than that of the controls. M. G. M.

Vitamins and their role in nutrition. L. A. Cherkes. *Klin. Med.* (U. S. S. R.) **15**, 1047–57(1937); *Chem. Zentr.* **1938, I**, 4350.—Permanent injuries resulting from vitamin and protein deficiencies and persisting even after long periods on a normal diet are discussed. Weakening of the ability to resist infection, derangement of certain organic functions, and shortening of the life span can, under certain conditions, be due to permanent injury, especially to the mesenchyme and nervous system, as the result of an insufficient supply of high-quality protein and vitamins during the period of growth. M. G. Moore

Calcium urolithiasis. The role of calcium metabolism in the pathogenesis and treatment of calcium urolithiasis. R. H. Flocks. *J. Urol.* **43**, 214–33(1940). J. Pinchack

Calcium citrate uroliths on a low-phosphorus diet. H. A. Schneider and H. Steenbock. *J. Urol*, **43**, 339–44 (1940).—Urinary calculi composed primarily of Ca citrate were produced in rats by feeding a diet low in P (0.04%) but complete in other respects. The mechanism of this formation and its physiol. significance are discussed. J. Pinchack

The biophotometric study of vitamin A in dermatological conditions. Harry L. Baer and Harold R. Vogel. *Urol. Cutaneous Rev.* **44**, 176–81(1940).—The biophotometer is not precise for detg. vitamin A deficiency in skin diseases. Where such deficiency exists, percutaneous and oral use of the vitamin is helpful in some skin conditions. Vitamin A is probably absorbed through the skin. J. Pinchack

Anemia due to iron deficiency. Clark W. Heath. *Symposium on the Blood and Blood-Forming Organs, Univ. Wisconsin* **1939**, 41–51.—Fe deficiency does not occur in the adult without blood loss or pregnancy. Inorg. Fe given by mouth in fairly large amt. is the treatment of choice. It is rarely, if ever, necessary to give Fe by injection. Fe is very toxic when given parenterally and the treatment dose is very close to the toxic dose. It takes 25 mg. Fe to produce a rise of 1% hemoglobin, and the injection of this amt. may cause nausea. Cu, HCl, liver ext. and the combinations of Fe with various substances are not necessary in the practical treatment of human hypochromic anemia. It is appropriate to give Fe in small prophylactic doses to infants after the 3rd month, to adolescent girls and to pregnant women. Maurice M. Rath

Liquid ammonia as a dietary supplement. Richard G. Roberts and Herman J. Horvitz. *Trans. Illinois State Acad. Sci.* **32**, No. 2, 124–6(1939).—Casein, starch and yeast were digested in liquid NH_3 until fluid, and the excess NH_3 was removed by evapn. *in vacuo*. The ammonolyzed material retains up to about 2% of the N, bound in the form of a deriv. Diets thus treated were fed to albino rats and, with certain exceptions, normal growth followed. The failure in the neg. cases was not due to any toxicity, but to the inactivation of the vitamin B present by the NH_3 treatment. Compared with NH_4 salts, ammonolyzed foods have certain advantages: They are cheap, they show less tendency to spoil, and apparently increase the digestibility of proteins. Besides inactivating vitamin B, they have the disadvantage of being unable to increase the protein N more than 20% without making the diet inedible. J. H. Reedy

Vitamin A deficiency in diseases of the liver: its detection by dark-adaptation method. Michael G. Wohl and J. B. Feldman. *J. Lab. Clin. Med.* **25**, 485–94(1940); cf. *C. A.* **33**, 5458[8].—In a group of patients with liver disease the degree of dark-adaptation pathology, as detd. with the instrument devised by F., appeared to run parallel with the degree of liver damage. In 3 patients with hepatocellular jaundice, who showed minimal liver damage as evidenced by the clinical course of illness and liver-function tests, the dark-adaptation readings were normal. Nine out of 10 alc. addicts showed vitamin A deficiency by this test. The diet of these patients prior to hospitalization was poorly balanced and was inadequate in vitamin A and vitamin B. Howard W. Robinson

Licanic acid of oiticica fat and a study of its nutritive value and efficiency. C. F. Krewson and C. A. Elvehjem. *Oil and Soap* **17**, 30–3(1940).—From the exptl. evidence obtained in feeding tests with young albino rats it appears that licanic acid possesses no apparent energy value and that under the conditions of the test it is slightly deleterious to the growth of young rats. It has some efficiency in the animal and assists in the utilization of lactose in milk as indicated by its prophylactic action in preventing sugar loss via the urine. 59 references. E. Scherubel

Spectroscopic changes in fat acids. IV. Acids from specimens of butterfat from cows under different nutritional treatments. James Houston, Albert G. Cotton, Stanislaw K. Kon and Thomas Moore. *Biochem. J.* **33**, 1626–9(1939); cf. *C. A.* **31**, 4517[7].—Fractions of the mixed fat acids obtained by high-vacuum distn. of the butterfat of cows at pasture showed spectroscopic absorption at 230 mμ. The intensity of absorption increased rapidly with the ascending I value (i. v.) of the fractions, in agreement with the conclusion that this absorption is attributable to polyethylenic acids. Similar results were obtained for fractions of the liquid acids from the butter of cows given cod-liver oil. Both the i. v. and absorption at 230 were greater in this case. No evidence was obtained of transference to the milk of the acids present in cod-liver oil which absorb at 270 mμ. Tung oil was poorly tolerated by cows, but small doses resulted in the appearance of absorption at 270 mμ in the butter acids at an intensity suggesting the inclusion of about 0.5% of unchanged eleostearic acid. There was no evidence of increased absorption at 230 mμ reported in the rat and hen when given tung

oil. **V. The effect of dietary fat on the body fat and egg fat of the hen.** Ethel M. Cruickshank, James Houston and Thomas Moore. *Ibid.* 1630–4.—The dietary fat had a marked effect on the amt. of polyethylenic acids present in the egg fat and abdominal fat as observed spectrographically after refluxing with KOH. When sperm oil was added to the diet the increases in absorption at 230 and 270 mμ were about equal. When linseed oil was added to a fat-free diet the absorption at 230 mμ was greater. The inclusion of tung oil in the diet caused a marked increase in the preformed absorption at 230 mμ in the egg and body fat acids. This change in the absorption max. is probably due to the loss of one of the conjugated unsatd. linkages of eleostearic acid. The results show a marked difference in the treatment of polyethylenic acids by the cow and the hen. **VI. General.** Thomas Moore. *Ibid.* 1635–8.—Catalytic reduction of tung oil caused a change in the position of the absorption max. of the mixed acids from 270 to 230 mμ. This finding supports the conclusion obtained from the results *in vivo*. Evidence was obtained to support the view that the increased absorption of polyethylenic acids when they are refluxed with KOH is caused by a re-orientation of the unsatd. bonds from unconjugated to conjugated positions. When large amts. of "pro-absorptive" polyethylenic acids were included in the diet of the rat, they were stored unchanged (spectroscopically). The predominance of absorptive acids found in the fats of some mammals, as the cow, cannot therefore be made the basis of a general rule. The absorption of the acids from rats receiving an almost satd. fat indicated, however, that when the intake of polyethylenic acids was low, these were converted into the absorptive form. Polyethylenic acids from dried grass were in the "pro-absorptive" state. Since the acids of the fats of herbivorous animals are in the "absorptive" form, they must have been converted in the animal. E. W. Scott

Vitamins in rat and guinea-pig milk. James Houston and Stanislaw K. Kon. *Biochem. J.* **33**, 1655–9(1939).—In rat milk the concn. per 100 ml. of vitamin A, carotene, vitamin B_1, riboflavin and vitamin C, resp., was 0.13 mg., not measurable, 50–80 I. U., 0.4–0.8 mg., 0.4 mg.; in guinea-pig milk the concns. in the same order were 0.09 mg., 0.011 mg., 20 I. U., 0.085 mg. and 29.0 mg. Phys. and chem. methods were used for the detns. When compared to cow milk, rat milk was richer in vitamin B_1 and riboflavin and much poorer in vitamin C. The amt. of the latter in guinea-pig milk is relatively enormous. When lactating rats were fed large amts. of riboflavin, its concn. in the milk was increased, but the feeding of vitamins B_1 and C had no effect on their concn. in the milk. The milk of rats on a vitamin B_1-deficient diet showed a sharp decrease in the concn. of this factor. E. W. Scott

The liver filtrate factor of the vitamin B_2 complex. T. F. Macrae, A. R. Todd, B. Lythgoe, C. E. Work, H. G. Hind and M. M. El Sadr. *Biochem. J.* **33**, 1681–7(1939); cf. *C. A.* **33**, 4648[1].—Liver filtrate factor (I) was not pptd. by salts of Pb, Hg, Ag, quinine or brucine, but was pptd. from alc. soln. by $Ba(OH)_2$. I was not adsorbed even on exhaustive treatment with fuller's earth, but it was adsorbed by large amts. of norite. AmOH and ether extd. I from acidified solns. By a combination of several methods of concn. a material was obtained that contained a rat day dose in 0.180 μg. of dry matter. Acetylation of I gave a product that was easily extd. from aq. soln. with $CHCl_3$ and had only weak activity; mild hydrolysis yielded a material that possessed a biol. activity similar to that of the starting material. The concentrate of I was not affected by treatment with CH_3N_3. E. W. Scott

Vitamin A and carotenoids in the livers of mammals, birds, reptiles and man, with particular regard to the intensity of the ultraviolet absorption and the Carr-Price reaction of vitamin A. H. B. Jensen and T. K. With. *Biochem. J.* **33**, 1771–86(1939).—The amts. of vitamin A (I) and carotenoids in the livers of 33 mammals of 21 species, 41 birds of 36 species, 4 reptiles of 2 species and 8 human subjects were detd. Most livers gave typical ultraviolet absorption curves similar to the curve of cod-liver oil. Tables were given showing the extinction coeff. of I at 328 mμ, the Carr-Price reaction with filters S59, S61 and S66.6 of the Pulfrich photometer and certain ratios of the extinction values, a brief description of the absorption curves and the zoölogical classification of the species examd. The absorption of I at 328 mμ and the extinction of the Carr-Price reaction with filter S61 had a fairly const. relation, the latter being 2.60–2.75 times the former with a coeff. of variation of 10–15%. In no instance was vitamin A_2 found. The Carr-Price absorption was fairly const. for all the livers examd. The variation in the amt. of I was very considerable, as was the variation in the amt. of carotene (II) in the livers examd. There was no simple relation between the amts. of I and II in the food ingested and the amts. in the liver. II was present in considerable amts. in the livers of certain beasts of prey and birds as well as in the herbivora, but most of the livers contained no carotenoid. E. W. Scott

Metabolism of sulfur. X. The replaceability of *dl*-methionine in the diet of albino rats with the partially oxidized derivative, *dl*-methionine sulfoxide. Mary A. Bennett. *Biochem. J.* **33**, 1794–7(1939); cf. *C. A.* **34**, 2002[2].—Albino rats showed identical growth curves when either compd. was fed as a supplement to a methionine-deficient diet. E. W. Scott

Maintenance nutrition in the pigeon. Further evidence for the presence of dietary essentials in yeast and liver and their relation to vitamin B_6. Cyril W. Carter and John R. O'Brien. *Biochem. J.* **33**, 1810–15(1939); cf. *C. A.* **32**, 2992[8].—Evidence was presented that the pigeon requires, in addn. to aneurin and riboflavin, a fuller's earth eluate factor and a fuller's earth filtrate factor that are present in yeast and liver. The eluate fraction from yeast had a marked wt.-restorative action, which attained a max. when the filtrate fraction was also added. Cryst. vitamin B_6 in daily doses of 0.040 mg. also increased the activity of the filtrate fraction, but its action was less than that of the eluate. The filtrate fraction of yeast and liver had little wt.-restorative action when it was supplemented with aneurin or riboflavin. E. W. Scott

The effect upon rickets of parenterally administered vitamins D_2 and D_3. A. Nitschke. *Z. Kinderheilk.* **61**, 385–96(1939).—The effect of the vitamins on infantile rickets was checked by clinical, röntgenological, and chem. methods. No cure was obtained in 9 infants with rickets and rickets plus tetany when vigantol (vitamin D_2) was given intramuscularly, intracutaneously and percutaneously. Both conditions were promptly turned to normal, however, by administering vitamin D_3 *per os* or by intramuscular administration of vitamin D_3 (20 times 1 cc. to 25 times 2 cc. of 7-dehydrocholesterol). Probably, vitamin D_3 is the natural form of the vitamin occurring in the human body and during or after intestinal absorption vitamin D_2 is changed into this active form. The theory considering infantile tetany as a "healing crisis" of rickets is not borne out by N.'s observations and should be abandoned. H. P. G. Seckel

The clinical picture of so-called renal rickets. U Stechele. *Z. Kinderheilk.* **61**, 448–60(1939).—Three types of renal rickets may be distinguished: (1) the classical type with interstitial nephritis, (2) the pyelonephritic type, and (3) the glycosuric-nephrotic type of Fanconi. A hyperphosphatemic case of the first type of renal rickets was observed over three years: After a dental infection and lobar pneumonia the boy, at the age of 6 years, developed a chronic nephritis with definitely impaired renal function and anemia (44% hemoglobin). Acute rickets with osteoporosis appeared. After a 6 weeks' course of salt-free and meat-free diet, the patient developed a hypochloremic coma. Blood analyses are given. A hypophosphatemic case of the third type (without glycosuria) with curable rickets and severe retardation of growth also is described. The hypophosphatemia was not corrected when rickets was cured and a Na_2HPO_4 tolerance test brought the serum P up from 3.3 to 8.6 mg.% in 2 hrs. and after 5 hrs. it was still as high as 5.2 mg.%. H. P. G. Seckel

Nutrition in war time. Katharine H. Coward. *Pharm. J.* **143**, 425(1939).—Progress made since 1914 in recogniz-

ing and utilizing essential food constituents to avoid deficiency diseases, is discussed as to starches, fats, proteins, vitamins and mineral salts. S. Waldbott

The production of uncomplicated riboflavin deficiency in the dog. A. E. Axelrod, M. A. Lipton and C. A. Elvehjem. *Am. J. Physiol.* **128**, 703–8(1940).—The basal ration of Street (*C. A.* **31**, 7474[8]) is shown to be adequate for the growing dog when supplemented with thiamine, nicotinic acid, vitamin B_6, the acid-acetone or hexane-butanol filtrate of liver ext. and riboflavin. In the absence of added riboflavin, acute deficiency is produced in 6 to 8 weeks. E. D. Walter

HOMER W. SMITH

Carbohydrate metabolism of various organs. E. S. London and N. P. Kochneva. *Acta Med. U. R. S. S.* **1**, 396–9(1938).—A review of authors' recent studies. B. C. P. A.

Progestin content of mature and early human placenta. J. Haffner. *Acta Obstet. Gynecol. Scand.* **18**, 125–35 (1938).—Detns. of progestin in an ext. of 10 kg. of mature placenta prepd. in 2 equal portions showed an av. content of ½ K. E. (Clauberg) per placenta. Twenty-seven placentas (deciduate tissue) from the first 3 months of pregnancy had an av. content of ⅛–½ K. E. per placenta. It is claimed that progestin is formed in the placenta as early as the first months, and concluded that habitual abortion is due to a failure of that function. B. C. P. A.

Endometrium of the monkey and estrone–progesterone balance. E. T. Engle and P. E. Smith. *Am. J. Anat.* **63**, 349–65(1938); cf. *C. A.* **33**, 6930[7].—Estrone was given for 10 days to spayed monkeys; increasing doses of progesterone were then injected together with a gradually reduced amt. of estrone. A more typical progestational phase of the cycle was produced than by an abrupt transition from estrone to progesterone. More glycogen is present in the endometrium and stroma in hyperestrinized monkeys than in those treated with progesterone. It is difficult to produce a benign hyperplasia of the endometrium in the monkey with estrone alone. B. C. P. A.

Anoxia and neural metabolism. R. W. Gerard. *Arch. Neurol. Psychiat.* **40**, 985–96(1938).—Brain respiration is 30 times as intense as that of resting muscle. The cerebellar cortex has the highest respiration rate and the highest contents of ascorbic acid and K. All the various current therapies for schizophrenia induce an increase in brain respiration either directly or on the rebound. B. C. P. A.

Nature of unsaponifiable substances of human serum. M. Bürger and K. Plötner. *Deut. Z. VerdauKr. Stoffw.* **1**, 225–35(1939).—4 fractions were isolated from the noncholesterol unsaponifiable substances, by the chromatographic method. One was a cryst. carbohydrate (C 84.48, H 15.35%), nonfluorescent in ultraviolet light; another contained C 81.58, H 11.82% and showed blue fluorescence. Fat acids are also present. The concn. of the whole group is increased under pathol. conditions. B. C. P. A.

Hypochloremia produced by posterior-pituitary extract. W. Ecke. *Deut. Z. VerdauKr. Stoffw.* **1**, 275–85(1939).—Two dogs on a salt-poor diet received multiple daily injections of 1–3 cc. of posterior-pituitary exts. subcutaneously for 9–12 days. Plasma Na and Cl fell without assocd. water loss. When treatment ceased hydremia set in and blood urea and nonprotein N rose. B. C. P. A.

Blood phosphatase in pregnancy. J. C. de Kerleau and J. Cayla. *Gynéc. obstét.* **39**, 112–15(1939).—Blood phosphatase begins to increase in the last trimester of pregnancy, reaching its highest level during the 9th month, and falls abruptly at delivery to a level equal to that of the newborn infant. B. C. P. A.

Histological distribution of potassium in muscle. J. Porto and A. D. Marenzi. *Rev. soc. argentina biol.* **14**, 483–5(1938).—The gastrocnemius and other muscles of *Bufo arenarum* were stained for K (MacCallum's technique modified by Rubin and Syrocki (*C. A.* **31**, 2297[5]) and Marza (*C. A.* **29**, 1117[9])). The K was uniformly distributed throughout the whole fiber. In the connective tissue, K is less abundant, especially toward the tendinous end of the muscle. The distribution of nerve fibers (stained by Cajal's method) did not coincide with the distribution of K. B. C. P. A.

Teeth of man, ape, dog and pig. G. Bremer. *Upsala Läkareforen. Forh.* **44**, 219–46(1938-39).—Methods and chem. analyses are given. B. C. P. A.

Effect of adrenaline on blood pressure in newborn dogs. G. Thiele. *Z. Kreislaufforsch.* **31**, 137–42(1939).—The blood-pressure response of dogs to adrenaline rises rapidly from very low values during the first 30 days of life and reaches normal values at 3–4 months. Up to 4 months bradycardia after adrenaline is almost regularly superseded by tachycardia. During the first days of life pain stimuli have a paradoxical effect on blood pressure but increase the rate and depth of breathing. Carotid sinus effects on blood pressure were slight at 9 days and reached their max. at 30 days. After denervation of the carotid sinuses and section of the vagi adrenaline apnea still occurred even in young dogs. B. C. P. A.

The physicochemical processes of muscular contraction. M. Dubuisson. *Ann. physiol. physicochim. biol.* **15**, 443–508(1939); cf. *C. A.* **33**, 207[9], 2200[7].—A review with 271 references. Ruth Berggren

Local vascular regulations. J. Malméjac. *Ann. physiol. physicochim. biol.* **15**, 621–775(1939); cf. *C. A.* **32**, 4204[4], 5068[7]; **33**, 3883[8].—A review with extensive bibliography. Ruth Berggren

Oxyphoric power of the blood and resistance to progressive anoxia. D. Cordier and J. Français. *Ann. physiol. physicochim. biol.* **15**, 812–15(1939).—Diminution of the oxyphoric power of the arterial blood by bleeding of normal or splenectomized dogs or by blocking of part of the hemoglobin by CO (in the latter case the oxyphoric power is the content of hemoglobin which can be oxygenated) up to about 10 vols. % does not modify perceptibly the resistance to progressive asphyxia due to O lack. This oxyphoric power of 10 vols. % appears to be a crit. value below which resistance to progressive anoxia becomes impossible. Ruth Berggren

Importance of the realization of the normal ascorbic acid value. A. Giroud and R. Ratsimamanga. *Ann. physiol. physicochim. biol.* **15**, 831–2(1939); cf. *C. A.* **33**, 704[7]; **34**, 476[8]. Ruth Berggren

The course of sympathin in the blood. Henri Hermann, F. Jourdan, G. Morin and J. Vial. *Ann. physiol. physicochim. biol.* **15**, 849–51(1939); cf. *C. A.* **32**, 2202[9].—A reply to various criticisms of earlier work. Whether sympathin exists normally in the blood is still an open question. Ruth Berggren

Relation between the amount and the fat content of human milk. U. S. Ružičić. *Monatschr. Kinderheilk.* 72, 71–3(1938); *Dairy Sci. Abstracts* 1, No. 1, 43. C. L. B.

Further investigations of chlorine metabolism with work and heat. Gunther Lehmann and Alexander Szakáll. *Arbeitsphysiol.* 10, 608–46(1939); cf. *C. A.* 32, 8502[1,2,3,4].—With a 19-year-old man a study was made of the metabolism of Cl and H_2O, body temp., pulse rate, basal metabolism, and R. Q. (Douglas-Haldane method, cf. *C. A.* 16, 2542), and morphological and chem. character of blood as influenced by work (bicycle ergometer) and high and low environmental temps. In one exptl. series the room temp. was 18–20° (relative humidity, 80–90%) and in others 37° (relative humidity, 50%). At the high temp. there were 3 groups of expts. with normal, min. and excessive Cl intake. With excessive intake, heat and work caused a loss of 8 g. of Cl and with lowered intake, 12 g. Strenuous work caused a marked dyspnea with hyperventilation, and the lowest utilization of O_2, air and blood. These results, ascribed to insufficient blood supply to the respiratory center, led to alky. of blood, decrease in level of blood Ca and tetanus cramps. With change from work and cold to work and heat, there was increased energy consumption, but this was overcompensated by progressive training. The R. Q. with work and heat was higher than at low temp. The blood Cl decreased regularly until the start of sweat secretion and then increased. The plasma protein increased greatly at start of work and, irrespective of different initial values, reached the same level under all conditions. Body temp. increased greatly at start of work at 37°, but gradually became lower with habituation. The striking parallelism between curves of body temp. with work and Cl concn. of sweat was due to the direct influence of body or skin temp. on activity of sweat glands. With work, blood sugar decreased much more at high than at normal temp., because of insufficiency of adrenaline production. The data for lactic acid agree with the view that its entrance into the blood is ascribable to the opening of inactive capillaries. Calcn. of the necessary amt. of liquid intake (based on idea that thirst depends on increase in osmotic pressure in tissues) gave results agreeing with the amt. drunk at will. These calcns. confirm the earlier rule that, in general, during work about half the loss of liquid should be replaced. Because the highly trained worker eliminates greater amts. of Cl-poorer sweat than the untrained individual, he needs greater amts. of liquid for equalization of osmotic pressure. Permanent changes in Cl content of blood resulting from work and heat are individually very different. Cl balance and body wt. do not parallel each other. T. M. Carpenter

Determination of the volume of heart stroke during rest and work, by gas-analytical and physical methods. Hans-Ulrich Matthes. *Arbeitsphysiol.* 10, 668–79(1939); cf. *C. A.* 26, 182.—With several 20–26-year-old students and a few 60–70-year-old workers, during rest and work (bicycle ergometer), comparisons were made of vol. of heart stroke as measured by Grollmann's C_2H_2 method (cf. *C. A.* 23, 3942), Knipping's N method (cf. *C. A.* 31, 4706[6]) and the sphygmographic methods of Broemser-Ranke and Böger-Wezler. Under rest conditions, the results by the 4 methods agreed. With change in position, the changes in circulation observed by the B.-R. method averaged less than those by the G. method. With light work, the G. method showed a 73% increase in vol. of stroke and the B.-R. method 35%. The Grollmann values probably were too high. With severe work, the values by the K. method agreed with those by the B.-R. method. As detns. during work were not possible by the B.-W. method, pharmacol. expts. (padutin by mouth) were made to compare the results by this method with those by the B.-R. method. In one group of these expts. the changes in circulation caused by padutin agreed by both methods; in a 2nd group the agreement was not so good but the results were nearly parallel; in a 3rd group the deviations between the 2 methods were great. With severe work, the vol. of stroke increased at first but gradually sank with onset of fatigue; circulation became insufficient when extreme exhaustion occurred. The results seemed greatly dependent on age. With static work (holding a weight in the hand, with arm outstretched), reactions did not occur until the utmost voluntary effort had been exerted. T. M. Carpenter

Preparation of pyrogen-free urogastrone. J. S. Gray, C. U. Culmer, E. Wieczorowski and J. L. Adkison. *Proc. Soc. Exptl. Biol. Med.* 43, 225–8(1940).—Exts. of normal human male urine prepd. by the BzOH adsorption method of Katzman and Doisy (*C. A.* 27, 762) contain large amts. of a pyrogenic substance in addn. to the gastric inhibitory substance urogastrone. From the crude mixt. a fraction, sol. in a 0.1 *N* soln. of HCl in 70% Me_2CO and insol. in 95% Me_2CO, was obtained which contained urogastrone but no pyrogen. L. E. Gilson

Histological demonstration of vitamin A in human liver by means of fluorescence microscopy. Hans Popper. *Proc. Soc. Exptl. Biol. Med.* 43, 234–6(1940); cf. *C. A.* 34, 1997[7]. L. E. Gilson

Studies on preserved human blood. V. Decrease in prothrombin titer during storage. E. D. Warner, Elmer L. DeGowin and Walter H. Seegers. *Proc. Soc. Exptl. Biol. Med.* 43, 251–4(1940).—In citrated blood stored aseptically at 5° the prothrombin decreased 9% in 10 days, 50% in 21 days and 70% in 30 days (av. of 12 samples). L. E. Gilson

Inactivation of methyltestosterone in castrate male rats. Gerson R. Biskind. *Proc. Soc. Exptl. Biol. Med.* 43, 259–61(1940); cf. *C. A.* 33, 9413[7].—Methyltestosterone, like testosterone propionate, does not exert its sp. effect on the genital organs of castrate male rats when implanted in pellet form in the spleen. It appears to be destroyed in the liver. When implanted subcutaneously, or in a transplanted spleen with the splenic vessels ligated, it exerts the expected effect. L. E. Gilson

Observations on [citrated] human blood stored at 4°. Wm. F. Lipp and Roger S. Hubbard. *Proc. Soc. Exptl. Biol. Med.* 43, 265–7(1940).—Albumin, globulins and fibrinogen all seemed to increase gradually for 30 days. Hemoglobin and erythrocyte count did not change significantly. Leucocyte count and sedimentation rate decreased. L. E. Gilson

Bisulfite-binding substances in the blood and cerebrospinal fluid. Herman Wortis, Ernest Bueding and Wm. E. Wilson. *Proc. Soc. Exptl. Biol. Med.* 43, 279–82 (1940).—Methods are described. The normal range of bisulfite-binding substances for human spinal fluid is 0.42–3.07, and for blood 2.0–5.7 mg. % (calcd. as pyruvic acid). The detn. cannot be used as an indicator of vitamin B_1 deficiency, it is often normal in various psychiatric disorders, and it is not an accurate measure of the pyruvic acid level. It is elevated after administration of paraldehyde because deproteinization of the fluids with CCl_3CO_2H partially hydrolyzes paraldehyde to AcH which binds bisulfite in the detn. L. E. Gilson

Factors in saliva correlated with the occurrence of calculus. Benjamin Tenenbaum and Maxwell Karshan. *J. Am. Dental Assoc.* 26, 1965–71(1939).—The av. concns. of total Ca and inorg. phosphate in both unstimulated and stimulated saliva and the av. pH of stimulated saliva of persons who form calculus were relatively such as to favor pptn. of the inorg. salts of the deposit. The protein content of the saliva was without significance. Joseph S. Hepburn

Comparison between dietary and hormonal factors in the development of dentin. Gerrit Bevelander and Margaret M. Hoskins. *J. Dental Research* 18, 533–46 (1939).—Disturbances in the dentin of rats, of a permanent nature, were produced by a low-Ca ration, variations in the Ca:P ratio and parathyroidectomy plus a Ca-deficient ration; similar disturbances with a reversion to normal followed parathyroidectomy. 11 references. Joseph S. Hepburn

Composition of pre-Columbian teeth. Calcium, phosphorus and carbon dioxide determinations on all the dentin and all the enamel. Ethel L. French, Helen Tefft,

Margaret Rathbun, Janet Eckhardt, Eileen Welch and Harold C. Hodge. *J. Dental Research* **18**, 547–56(1939).—In 32 pre-Columbian teeth, on the dry basis, the enamel contained 98.0% inorg. compds., the dentin 80.0%. The av. percentage compn. of the inorg. constituents was: enamel, Ca 37.1, P 17.6, CO_2 1.98; dentin, Ca 35.7, P 16.6, CO_2 3.31. No significant differences were noted between 5 carious teeth and the sound teeth.
Joseph S. Hepburn

Acid solubility of human enamel. J. F. Wolker. *J. Dental Research* **19**, 1–10(1940).—Gravimetric detns. of the soly. of human enamel in an AcOH-AcONa buffer of pH 4.0 in 1 hr. showed deciduous enamel to be more sol. than permanent enamel, with no striking difference between enamel from carious and from noncarious teeth or between young and old permanent enamel, but a possible decrease in the soly. with age. 18 references.
Joseph S. Hepburn

The saliva of the hen. E. E. Leasure and R. P. Link. *Poultry Sci.* **19**, 131–4(1940).—The saliva of 30 mature hens (av. 12 cc./24 hrs.) was a milky gray to clear fluid with a characteristic odor, bordering on putrid, with a pH of 5.92–7.15 (av. 6.75) and an av. d. of 1.0135. Microscopic examn. showed mucin shreds, bacteria, spirilla, debris, epithelial cells, leucocytes, fungi (1 sample only) and fat droplets. Salivary amylase was always present, salivary lipase was present, though relatively inactive or in extremely small quantities, salivary proteinase was negligible or absent and salivary rennin was absent.
K. D. Jacob

Response of pullets to androgens. W. R. Breneman. *Poultry Sci.* **19**, 147–53(1940); cf. *C. A.* **33**, 8255[8].—Pullets injected with Oreton (testosterone propionate) or Oreton-B (dihydroandrosterone benzoate) from the 1st to 4th or 5th to 9th day after hatching do not give as marked response to these androgens as do cockerels of the same age and there is no clear difference in response between the combs of these chicks which receive 0.125 or 0.25 mg. hormone daily. After cessation of injections, the combs continue to grow but more slowly than do those of cockerels given similar treatment. Subsequent to the 20th day there is an indication of hormone antagonism. There is evidence of the probable secretion of an estrogen by the ovary which acts antagonistically to the androgen at this time. Addnl. support for the possibility that an estrogen may be responsible for the comb growth in the pullet is furnished by the fact that comb sizes in capons injected with theelin exceed those in control birds. Some exptl. evidence of the inhibition of Oreton-B by theelin is presented.
K. D. Jacob

Composition of the blood of horses, asses and mules in connection with heterosis of mules. Kh. F. Kushner. *Bull. acad. sci. U. R. S. S., Sér. biol.* **1939**, 171–88(in English, 188); cf. *C. A.* **34**, 498[1].—The chief constituents of the blood responsible for its oxidizing functions (no. of erythrocytes, hemoglobin content, blood alky.) show the highest indexes in the mules, then in horses and asses. Thus the heterosis of the mules in respect to the working ability and resistance is partly conditioned by the higher oxidation capacity of their blood. 46 references.
C. Jarowski

Investigation of the composition of the blood of Yaroslav cattle in connection with their productivity. Kh. F. Kushner. *Bull. acad. sci. U. R. S. S., Sér. biol.* **1939**, 189–205(in English, 206); cf. *C. A.* **34**, 498[1].—The hemoglobin content, size and no. of erythrocytes and reserve alky. were all greater in cows of the high record class, distinguished from all the other cows by their higher milk productivity, greater body wt. and higher index of eurysomy. The lower the index of eurysomy in other breeds, the lower is the index of the oxidizing ability of the blood. 59 references.
C. Jarowski

Mineral composition of colostral milk. O. F. Garrett and O. R. Overman. *J. Dairy Sci.* **23**, 13–17(1940).—At parturition sp. gr., total solids, total ash, total protein and fat are high. The initial high values are followed by a fairly steady decline during the colostral period. The lactose was low at parturition but gradually increased as the milk became normal. Ca, Mg, Na, P_2O_5 and Cl are all high at parturition and during the early hrs. of lactation, but a rather rapid decline toward a fairly const. level sets in as the milk becomes normal. On the other hand, K is low at parturition but gradually increases toward a fairly const. level as the milk progresses toward normality.
A. H. Johnson

The composition of bovine blood. II. Seasonal variations in the level of magnesium in the blood plasma of growing dairy calves. C. W. Duncan, C. C. Lightfoot and C. F. Huffman. *J. Dairy Sci.* **23**, 125–34(1940); cf. *C. A.* **33**, 7081.—The detn. of plasma Mg in 2286 samples of blood from 107 calves showed changes in concn. of Mg for the various months of the year and a marked seasonal drop that occurred during the transition from winter to summer conditions when the calves had to adjust themselves to new weather conditions. A no. of direct environmental factors, temp., sunshine, precipitation, barometric pressure and relative humidity were considered and linear correlations are indicated to show some apparent relationships with plasma Mg, but none have been found wholly satisfactory in explaining why these alterations occur in the animal body. Lower plasma Mg values were assocd. with those months during which there were more than 8 hrs. of sunshine per day and when the mean and max. temps. were above 55 and 70°F., resp. The change in concn. of Mg cannot be ascribed to the effect of solar radiation, because the Mg values obtained from the young calves which did not have access to direct sunlight responded in the same manner as those which were turned out to pasture. The results of the study suggest a striking parallelism in the concn. of Mg to changes in season. Periods of high and low concn. not attributable to age or to the ingestion of food are definitely indicated.
A. H. Johnson

Renal mechanisms controlling composition of the body fluids. Donald D. Van Slyke. *Chem. Rev.* **26**, 105–27 (1940).—A review.
Louise Kelley

Peroxidase reaction. CXXIII. Arakawa's reaction and vitamin C content of human milk. 5. Difference between Arakawa-negative human milk and human milk made Arakawa-negative by added ascorbic acid. Siroku Isono. *Tohoku J. Exptl. Med.* **37**, 216–21(1939); cf *C. A.* **33**, 8275[7].—Arakawa reagent III oxidized the vitamin C of human milk. The presence of H_2O_2 and guaiacol is required for this oxidation. The reagent permits differentiation between Arakawa-neg. milk and A.-pos. milk made A.-neg. by addn. of vitamin C. **CXXIV. Qualitative reactions for methylglyoxal in human milk and their results compared with the quantitative value of the methylglyoxal-like substance in it.** Siu Sato. *Ibid.* 222–9.—The methylglyoxal-like substance in milk was successfully identified and detd. Fischler and Boettner's method (*C. A.* **22**, 2901), the Denigès' reaction, the pyrrole reaction and the pptn. reaction with 2,4-dinitrophenylhydrazine were used. It is probable that the substance extd. by Takamatsu (*C. A.* **28**, 4080[8]) from Arakawa-neg. milk is methylglyoxal. **CXXV. Variation of the amount of methylglyoxal-like substance in human milk on administration of vitamin B_1 with or without yakriton, and on antisyphilitic treatment; initial and temporary exacerbation of Arakawa's reaction on administration of vitamin B_1.** *Ibid.* 230–40.—The methylglyoxal content decreases in Arakawa-neg. milk on treatment of the mothers with vitamin B_1, with or without yakriton, and in luetic cases on antiluetic treatment. This is preceded by an initial and temporary increase and a corresponding weakening of the A. reaction. **CXXVI. Further report on the blood platelet count of mothers with different Arakawa reactions.** Siguo Kimura. *Ibid.* 241–54.—The weaker the reaction, the higher the count. **CXXVII. The increase of methylglyoxal-like substance and the change of Arakawa's reaction in rabbit milk on administration of monoiodoacetic acid; recovery through vitamin B_1 and yakriton.** Siu Sato. *Ibid.* 255–62.—The acid was injected into lactating rabbits, causing a steady increase in methylglyoxal. The Arakawa's reaction became neg. The animals lost wt. In mild cases these toxic symptoms receded on vitamin B_1

treatment. In severe cases recovery resulted only when the vitamin was supplemented by yakriton. Cf. *C. A.* **34**, 2051[4]. T. Laanes

Calcium metabolism and teeth. Rudolph Kronfeld. *Illinois Dental J.* **9**, 95–7, 117(1940).—Review. H. M. Leicester

Antiketogenic and glycogenic activity of citric acid. Eaton M. MacKay, Herbert O. Carne and Anne N. Wick. *J. Biol. Chem.* **133**, 59–65(1940).—Citric acid is as effective as glucose in relieving insulin hypoglucemia in rats. It is active in the formation of liver glycogen and has a marked antiketogenic action. A. P. Lothrop

Basic amino acid content of human serum proteins. The influence of the ingestion of arginine on the composition of the serum proteins. Richard J. Block. *J. Biol. Chem.* **133**, 71–4(1940).—Human serum proteins prepd. by heat coagulation or by pptn. with 2 vols. of alc. or 5 vols. of Me_2CO have approx. the same basic amino acid compn., and proteins pptd. from serum contg. 0.5% of arginine-HCl yield little if any extra arginine. The arginine content of the serum proteins was not appreciably increased by the ingestion of relatively large amts. of arginine-HCl by 2 human beings. These findings are not in accord with those reported by Dirr (*C. A.* **33**, 7898[5]). A. P. Lothrop

Effect of repeated insulin hypoglucemia on the lipide composition of rabbit tissues. Lowell O. Randall. *J. Biol. Chem.* **133**, 129–36(1940); cf. *C. A.* **32**, 9248[6].—A small but statistically significant decrease in the phospholipide and neutral fat content of nervous tissues followed repeated insulin hypoglucemic convulsions induced in 17 rabbits. There was no change in the cholesterol content and there was also no effect on the phospholipide and cholesterol content of the liver, kidney, spleen and muscle. Neutral fat was increased in the liver and kidney only. The adrenal glands hypertrophied and there were increases in the abs. amts. of phospholipide and neutral fats. The free and ester cholesterol remained const. On a percentage basis the amts. of phospholipide and free cholesterol remained const.; the ester cholesterol was decreased and neutral fat increased. A. P. L.

Ketosis. XVII. The rate of disappearance of β-hydroxybutyric acid in fasted and fed rats. Harry J. Deuel, Jr., Lois F. Hallman, Paul O. Greeley, Joseph S. Butts and Nellie Halliday. *J. Biol. Chem.* **133**, 173–82(1940); cf. *C. A.* **33**, 7856[3].—When *l*-β-hydroxybutyrate was injected intraperitoneally into fasted, nephrectomized rats, the rate of disappearance was significantly lower than in animals receiving glucose. This finding together with the decrease in ketonuria earlier observed following administration of carbohydrate seems to indicate that glucose increases the rate of disappearance of β-hydroxybutyric acid from the tissues of the fasting rat by an acceleration of oxidation (ketolysis) rather than by a suppression of its formation from endogenous sources (antiketogenesis). A. P. Lothrop

The distribution of ketone bodies in tissues. Helen C. Harrison and C. N. H. Long. *J. Biol. Chem.* **133**, 209–18(1940).—When ketosis of endogenous origin is produced by fasting, treatment with anterior pituitary ext. or injection of phlorizin, there is an increase of ketone bodies in the liver cell water. The ratio $Ket._l/Ket._p$ remains const. at all levels of plasma concns. within the limits of exptl. error. On the other hand, appreciable amts. of ketones are not found in the muscle cell water until the concn. in the plasma is elevated to about 70–80 mg. per 100 cc. (expressed as β-hydroxybutyric acid). As the concn. in the plasma increases above this level, the amt. in the muscle cell also increases. The distribution ratio $Ket._m/Ket._p$ increases with increasing concns. of ketones in the plasma but it never reaches the value for $Ket._l/Ket._p$. After administration of β-hydroxybutyric acid the distribution of ketone bodies in the liver and muscle is similar to that observed in ketosis of endogenous origin. These findings indicate that the ketogenic effects of fasting, anterior pituitary ext. and phlorizin are due to their action upon liver cell metabolism in bringing about an increased ketone body production and also that ketones are utilized by the muscle cell. A. P. Lothrop

The lipide content of blood, liver and yolk sac of the newly hatched chick and the changes that occur in these tissues during the first month of life. C. Entenman, F. W. Lorenz and I. L. Chaikoff. *J. Biol. Chem.* **133**, 231–41(1940); cf. *C. A.* **33**, 2195[8], 4642[9].—The bird enters the external world with a lipemia and a fatty liver which contains an enormous amt. (7.3%) of cholesterol, 90% of which is in the esterified form. The blood contains as much as 1000 mg. of total lipide per 100 cc. of whole blood and all the lipide constituents are present in amts. greater than in the blood of the mature male and nonlaying female bird. On the 3rd day after hatching a rapid decline in the lipide content of the blood and liver sets in and the rapid fall in esterified cholesterol is assocd. with a temporary rise in triglycerides. At hatching the yolk sacs contain about 12% fat acids, 1.6% phospholipide and 1.3% total cholesterol but their absorption proceeds rapidly and is nearly complete by the time the chicks are 5 days old. Neutral fat is absorbed more rapidly than the other lipide constituents. A. P. Lothrop

Preparation and assay of anterior pituitary fractions rich in ketogenic and respiratory quotient-reducing substances. Joseph D. Greaves, Irene K. Freiberg and H. E. Johns. *J. Biol. Chem.* **133**, 243–59(1940).—A method of assay is described for the R. Q.-reducing substance of the anterior pituitary gland, based on the effect of the intraperitoneal injection of the ext. upon the R. Q. of rats fasted 20 hrs. before and fed glucose 2 hrs. after the injection of the ext. under assay. An approx. unit is defined as that amt. of material which will reduce the R. Q. to 0.8 (from the control values of 0.86–0.94). The effects of the same exts. on the blood and urinary ketone body levels are also studied in the fasted rats. The factor is best isolated from frozen glands by extn. at pH 11.0 rather than by neutral, acid, buffer or saline solvents. It is heat-labile (100° at pH 10 for 15 min.) and non-diffusible through cellophane or collodion. The activity of different exts. does not parallel their melanophore content. The larger part of the factor is salted out by full satn. with NaCl or 0.2 to 0.45 satn. with $(NH_4)_2SO_4$. Isoelectrically a large part is pptd. at pH 6.7–5.75 and the activity is not destroyed with excess cysteine at pH 8. It is more stable in the pH range 9.5–11.0 than at higher or lower pH and is much less stable in acid soln. Prepns. have been obtained which were active in a unit dose of 0.17 mg. of protein. The best fractions were rich in growth factor and contained only small amts. of lactogenic and adrenocorticotropic material. The ketogenic and R. Q.-reducing potencies ran approx. parallel but sepn. of the 2 has not been effected. Forty-five references. A. P. Lothrop

Separation in nearly pure form of luteinizing (interstitial cell-stimulating) and follicle-stimulating (gametogenic) hormones of the pituitary gland. R. O. Greep, H. B. van Dyke and Bacon F. Chow. *J. Biol. Chem.* **133**, 289–90(1940); cf. *Proc. Am. Physiol. Soc.*, *Am. J. Physiol.* **126**, P 462(1939).—A method is described for the sepn. and purification of the luteinizing and follicle-stimulating hormones of the pituitary gland based on pptn. of the former by Na_2SO_4 and of the latter by $(NH_4)_2SO_4$ from purified exts. contg. acetate buffer at pH 4.41. In immature hypophysectomized rats a total dose of 0.002 mg. caused a detectable gonadotropic effect and definite ovarian hypertrophy was produced by 0.01 mg. of follicle-stimulating hormone but not by 0.002 mg. A. P. L.

Hibernation of the hedgehog. VII. Cholesterol metabolism. Paavo Suomalainen. *Ann. Zool. Soc. Zool.-Botan. Fennicae Vanamo* **8**, No. 2, 12 pp.(1939); cf. *C. A.* **34**, 1723[4].—Cholesterol content of the serum, adrenal, spleen, brain, liver, kidney and hibernating gland of hedgehogs is detd. by Theorell's modification (cf. *C. A.* **24**, 5362) of Bloor's method (total) and Kalaja's modification of Katsura, Hatakeyama and Tajima's method (cf. *C. A.* **28**, 4094[1]) (ester). Serum total cholesterol is highest during hibernation, falls on awakening, throughout the spring, and rises during the summer.

Esters/total cholesterol ratio does not change. Awakening is accompanied by an increase of 1000 mg. % total cholesterol in the adrenal, 900 mg. % of which is ester. A less pronounced increase, not occurring in the ester fraction, is found in the spleen. Rise in hibernating gland content may be due to its decrease in size. Total cholesterol is const. in brain and kidney throughout the year. Liver content changes only slightly, being highest in Sept. Adrenal changes may be assocd. with activity of the sex organs. Janet McAfee 1

The fate of prolan in the organism. C. M. Stamler. *Bull. biol. méd. exptl. U. R. S. S.* **3**, No. 1, 35–8(1937); *Chem. Zentr.* **1938, I**, 4197.—Prolan administered intravenously disappears only slowly from the blood of dogs and geldings, and at least 11% is excreted again in the urine in the case of dogs and 5% in the case of geldings. In being excreted in this manner prolan differs from the gonadotropic hormone obtained from the serum of pregnant mares. M. G. Moore 2

Extractive substances of the heart muscle. II. Creatine, methylguanidine and anserine in the heart muscle. M. Mogilevskiĭ. *Bull. biol. méd. exptl. U. R. S. S.* **3**, 291–2(1937); *Chem. Zentr.* **1938, I**, 4352; cf. *C. A.* **33**, 6415[4].—Creatine, methylguanidine and a substance whose properties were very like those of anserine were isolated from aq. exts. of the heart muscle of large, horned, domestic animals. M. G. Moore 3

The influence of prolan on the sexual activity of mares. B. M. Zavadovskiĭ and M. B. Goldberg. *Bull. biol. méd. exptl. U. R. S. S.* **3**, 357–9(1937); *Chem. Zentr.* **1938, II**, 3411.—Previously sterile mares were treated with relatively small doses of prolan (500–1000 mouse units was divided into 3 doses administered on the first 3 days of estrum). In 50–60% of cases pregnancy followed. Nymphomania should be treated with larger doses (2000–7500 mouse units). After repeated matings, some of the treated animals became pregnant at once, some the following year. No control expts. in order to det. the percentage of spontaneous recovery from the condition are reported. M. G. Moore 4

Quantitative investigations in the case of treatment with prolan. Ya. M. Kabak. *Bull. biol. méd. exptl. U. R. S. S.* **3**, 360–1(1937); *Chem. Zentr.* **1938, II**, 3411.—Groups of rats were given preliminary treatment with doses of prolan of varying size over a long period of time (3 months) and then tests were made to det. the threshold dose of prolan for the various animals. Animals which had received large doses during the preliminary treatment showed a greatly reduced sensitivity to the prepn. Thus for animals which had received 10 mouse units (M. U.) daily the threshold was 250 M. U.; this value was reduced to 5 M. U. when the animals had received only 0.1 M. U. of prolan daily; it was 100 M. U. when the daily dose had been 1 M. U. Thus the threshold value and the preliminary daily dose are not directly proportional. This increasing lack of sensitivity of the organism to prolan must be taken into consideration in cases where the prepn. has already been administered. M. G. Moore 5

Action of the thyrotropic hormone of the anterior lobe of the pituitary body on the animal organism. C. I. Ratner. *Problemy Endokrinol.* **2**, 175–94(1937); *Chem. Zentr.* **1938, I**, 4487.—The influence of the thyrotropic hormone on the thyroid gland and on the protein, carbohydrate and I metabolism of guinea pigs and dogs was studied. The daily dose was 5 units for guinea pigs and 25 units for dogs. An increase in post-mortem autolysis was observed. There was also a sharp decrease in the liver glycogen which persisted up to the 12th injection, after which this substance increased again up to normal. The blood sugar was not essentially changed. In dogs the I content of the blood increased up to the 10th injection and then decreased to normal. Changes in the histological picture of the thyroid showed the same regularity, which indicated a close relationship to the metabolic changes. The latter, therefore, are to be regarded as a result of a hyperfunctioning of the thyroid, which under long continued influence of the thyrotropic hormone becomes insensitive to it. M. G. Moore 6

Reducing substances (vitamin C) in saliva. H. Bober. *Zahnärztl. Rdsch.* **47**, *Paradentium* **10**, 155–9(1938); *Chem. Zentr.* **1938, II**, 3417.—A crit. review. M. G. Moore 7

Hormones and resistance. An acute antinarcotic and antitoxic effect of the estrogenic hormones. Tore P. Stortebecker. *Acta Path. Microbiol. Scand.*, Suppl. **41**, 1–283(1939).—Animals and human beings show great individual variations in their tolerance to narcotics and numerous poisons. The endocrine system has some bearing on this variation. The blood ether was detd. in rabbits which exhibited the same degree of narcotic effect (corneal and lid reflexes). Rabbits in estrus showed higher blood ether values indicating a high tolerance. Castrated rabbits and mice showed low ether values. After castration in estrus, the previous high ether values decreased; this indicated that castration decreased the tolerance. Castration decreased resistance to alc. intoxication, and treatment with estrone brought the resistance back up. The administration of estrogens increased resistance to Mg and KCN. Neither vitamin D, progesterone, thyroxine, parathyroid hormone, nor the gonadotropic factor of the pituitary had any effect on Mg narcosis in spayed animals. In normal animals the blood Ca is fairly consistent, but after castration it is augmented as much as 30%, then the administration of estrone causes it to fall as much as 20% in 2 hrs. Treating castrated female guinea pigs or pigs with atrophic ovaries with estrone produced abnormal fat accumulation in the parenchymatous organs especially the liver, and a tumor-like fat accumulation in the parametrium consisting of adipose tissue, connective tissue and phagocyte-like cells. These antinarcotic and antitoxic effects of estrogens are probably due to: (1) changes in the nervous system which are connected with Ca metabolism and which may thus influence permeability of the cells, (2) an increase in the power and capacity of the organism, (3) increased detoxification processes in the liver. 700 references. John T. Myers 8

The direct and indirect determinations of estrogenic and gonadotropic hormones. E. von Haam. *Am. J. Clin. Path.* **10**, 205–21(1940).—Good results were obtained in the detn. of gonadotropic and estrogenic substances in the urine by the alc. or tungstic acid pptn. of an aliquot part of a 24-hr. specimen with subsequent assay by the Levin-Tyndale method (cf. *C. A.* **31**, 7978[2]) for gonadotropic substances, and the Lauson method (*C. A.* **33**, 2198[7]) for estrin (hydrolysis and benzene extn. with tests on the uterus of immature mice). Single hormone assays, even if properly correlated, showed results other than normal in 70% of endocrine disorders. A weekly study of the cycle is a much better method of differentiating endocrine disturbances. An increase or decrease as compared with the normal standard given by the method employed has more clinical value than an expression of mouse units. For an adequate survey of sex hormones in the urine of menstruating women, at least 3 weekly detns. during one cycle should be made on 24-hr. specimens. In pregnancy women should be examd. monthly, and in other conditions twice at biweekly intervals. For quick orientation on the field of female endocrine disorders, detn. of the prolan content of a 24-hr. specimen will suffice. If abnormally increased in relation to the period of the cycle, primary ovarian hypofunction is suggested. Its permanent absence assocd. with amenorrhea is a definite sign of hypogonadism. John T. Myers 9

The normal bromine content of the blood of healthy individuals. Helen L. Wikoff, Richard A. Brunner and H. Willard Allison. *Am. J. Clin. Path.* **10**, 234–7(1940).—In 170 cases the Br value ranged from 0.33 mg. % to a high value of 1.73 mg. In 70 cases the figure did not differ from the av. of 0.81 mg. by more than 0.1 mg. In 137 cases the difference was not more than 0.2 mg. All of the cases were relatively young, no figures being given for middle aged or elderly persons. John T. Myers

The respiration and the circulatory system in females with ovarian dysfunction. David Scherf. *Ann. Internal Med.* **13**, 1413–30(1940).—In patients with ovarian hypofunction prolonged conduction time and abnormal sinal

deflections may be found in the electrocardiogram. There are also changes in respiration. These changes disappear with the administration of follicular hormone. Such findings may be due to overactivity of the pituitary with the production of such hormones as the thyrotropic and adrenotropic substances, when the retarding effect of folliculin is decreased or removed. 35 references. John T. Myers

Chemical specificity in growth and development. Frederick S. Hammett and Stanley P. Reimann. *Ann. Internal Med.* 13, 1483-8(1940).—A discussion with 22 references. John T. Myers

Conditions for estrogenic action. H. Druckrey. *Arch. exptl. Path. Pharmakol.* 192, 85–9(1939).—Yohimbine and its α-bromoisovaleryl, diethylacetyl and monostearyl esters are not estrogenic, contrary to other reports. High doses of vitamin A (120,000 units Vogan) do not inhibit the action of estrone. The estrogenic dose of follicular hormone necessary in castrated rats is increased by hysterectomy. J. Pinchack

Preliminary report on effect of cold on oxygen content of the blood. Malcolm C. Grow. *Military Surgeon* 86, 225-35(1940).—The mental distortion, confusion, incoherence, coma and death seen in cases of frost-bite and exposure to extreme cold are also found in anoxemia. These symptoms are due not to toxic substances in the blood, but to anoxia. Preliminary tests in animals and human subjects indicate that extreme cold decreases O utilization of the tissues. If anoxia is an important factor in such cases, O and a small percentage of CO_2 should be a valuable first-aid measure. The entire subject has a bearing on industrial efficiency where work is performed at low temps. J. Pinchack

A qualitative difference in the effect of compounds separated from the adrenal cortex on distribution of electrolytes and on atrophy of the adrenal and thymus glands of rats. B. B. Wells and E. C. Kendall. *Proc. Staff Meetings Mayo Clinic* 15, 133–9(1940).—A highly concd. cortin fraction (I) substantially free from cryst. substances related to corticosterone (II) maintains adrenalectomized dogs, but even in 30 times the maintenance dose of II it does not atrophy the adrenal cortex, as does II and its acetate. Desoxycorticosterone (III) and its acetate also do not produce adrenal atrophy. I reduces the thymus wt. 27%, II 63%, III not at all. Only III acetate suppresses the serum K to 2.8 or 3.0 milliequiv./l. These results can only mean differences in the chem. structure of the 3 substances studied. The atrophy produced by II and the presence of an OH group on C_{11} appear to be essentially related. The ester form of II and III is more active physiologically. J. Pinchack

The biologic characteristics of equine gonadotropic hormone. C. F. Fluhmann. *Western J. Surg., Obstet. Gynecol.* 48, 63–74(1940).—Equine gonadotropic hormone is an entity separate from either the anterior pituitary or the chorionic gonadotropic principles. Theoretically, it is indicated in failing ovulation not of primary ovarian origin, but preliminary clinical results with it have not been encouraging. J. Pinchack

Menstrual disorders treated with follicle hormone. Herman Anker. *Acta Obstet. Gynecol. Scand.* 19, 9–27 (1939).—Of 7 cases of menorrhagia (6 of the juvenile type), who were treated by daily injections of 10,000 mouse units of different prepns. of follicle hormone, 2 developed normal menstrual cycles, 3 showed a decrease in hemorrhages followed by amenorrhea for several months and in 2 the hemorrhage was slightly diminished. Of 5 cases of secondary amenorrhea or oligomenorrhea treated with follicle hormone alone or combined with corpus luteum hormone 3 reacted favorably. Two showed enlargement of infantile organs and 1 became pregnant. Hemorrhages occurred during or immediately following cessation of treatment with follicle hormone. In the 2nd group 10,000-50,000 mouse units of follicle hormone were used. Maurice M. Rath

Pulmonary gaseous exchange at low barometric pressure and in air mixed with nitrogen. D. B. Dill, H. T. Edwards and S. Robinson. *J. Aviation Med.* 10, 3–11 (1939).—Studies were made on physiol. function during exposure to reduced O in a low-pressure chamber. The O uptake by the blood at 90 mm. Hg partial pressure of O in inspired air, at a barometric pressure of 755 mm., was the same when the partial pressure was 86 mm. Hg at barometric pressure of 435 mm. (even though the addn. of CO_2 and H_2O vapor in the lungs at higher barometric pressure reduces the partial pressure of O less than it does at lower pressure). Under conditions of the expt., reduction in free and combined CO_2 of arterial blood and increase in alky. were twice as great at low pressures. The results are interpreted as a more complete mixing of alveolar air with air in the dead space which occurs when air in the lungs is reduced in density. Replacing part of the O of air with N, without change of total pressure, did not modify the rate at which CO_2 left the pulmonary membrane. When the ratio of O to N was kept const., while the total pressure was reduced, movement of both CO_2 and O mols. within the air spaces of the lungs was freer than at ordinary pressure. Maurice M. Rath

Can medical induction of labor be improved with estrin? S. Schürger. *Zentr. Gynäkol.* 63, 207(1939).—In 18 cases with labor absent after term, labor was induced by the administration of castor oil in addn. to 10,000 or 50,000 units of estrin followed by 2 to 8 doses of 0.2 to 0.3 cc. thymophysin. In 15 cases birth followed in 5 to 16 hrs. Maurice M. Rath

Modified Fluhmann procedure. Usefulness and evaluation of estimation of fluids containing small amounts of folliculin. Karl v. Pallos. *Zentr. Gynäkol.* 63, 506–15 (1939).—The Fluhmann technique (cf. *C. A.* 28, 199[6,8]) for injecting blood serum into mice, after which the vaginal mucosae are sectioned and examd. histologically, was tested with simple aq. solns. of estrogen. The reaction occurred in 4 stages: inactivity, proliferation, mucification and cornification, which occurred in that order with increasing doses of estrogen. The results of the expts. confirmed Fluhmann's findings. The method is a quant. expression of increasing dose. The end point can be read with equal facility in 36 or 48 hrs. Maurice M. Rath

The sympathicotropic activity of follicle hormone. G. Effkemann and H. Strüver. *Zentr. Gynäkol.* 63, 1248–54(1939).—The effects of estrogens were evaluated by photographic recording of the pupillary accommodation of the cat exposed to const. light stimulus, when under morphine, atropine or *d*-pseudoephedrine, with and without pretreatment with estrogen. The graphic records showed greater dilation of pupils with estrogen pretreatment, the effect being most marked with morphine. The pupil was larger from estrogen alone, before use of the mydriatic drugs. Maurice M. Rath

The fate of oxaloacetic acid in different organs. F. L. Breusch. *Biochem. J.* 33, 1757–70(1939).—Freshly minced spleen, lung, placenta and peripheral nerves decarboxylated added oxaloacetic acid (I) to pyruvic acid (II). Muscle, liver, kidney and pancreas reduced I to *l*-malic acid (III) in addn. and also reduced the II formed to lactic acid (IV). Kidney also condensed I with II to form citric acid (V). Muscle did not form citric acid, contrary to the citric acid cycle theory of Krebs (*C. A.* 31, 8655[6]). A new method of extg. the enzyme that reduced I to III was described. Its pH optimum was in the alk. range. It was very unstable, needed coenzyme and was destroyed by heating. The enzyme (termed *citrogenase*) that condensed I with II to form V was heat-labile and had a pH optimum at 7. It was not present in detectable traces in any muscle examd. In the competition for I between reduction to III and formation of V, the former reaction was definitely predominant. The formation of V appeared to be chiefly an elimination process and occurred only above a certain threshold of I. It was probably used as a means of eliminating C_4-dicarboxylic acids not excretable in the urine. The enzyme that catalyzed the reaction of I with glutamic acid (VI) was extd. from tissue by phosphate and purified by pptn. with $(NH_4)_2SO_4$. It was heat-labile, had a pH optimum of 7 and was present to the same extent in all organs. The order of spontaneous inactivation of the enzymes in minced

kidney tissue was studied. The one that reduced I to III disappeared first, then that which condensed I with II and finally the one that condensed I with VI. The thermostable substance that catalyzed the decarboxylation of I to II remained unchanged. The spontaneous decarboxylation of I was twice as fast in acid soln. as in alk. soln. E. W. Scott

Magnesium and muscle respiration. Sidney Elsden. *Biochem. J.* **33**, 1890–4(1939).—Mg, especially in the presence of succinic or fumaric acids, stimulated the respiration of minced pigeon-breast muscle. The stimulating action of boiled muscle ext. on this respiration could not be completely accounted for by its content of Mg and dicarboxylic acids. Iodoacetic acid (0.001 *M*) completely inhibited the succinic acid-Mg effect after a latent period of 30 min. E. W. Scott

The interrelation of lipides in the blood plasma of White Leghorn cockerels. Eldon M. Boyd and Eleanor L. Clarke. *Can. J. Research* **18, D**, 49–52(1940); cf. *C. A.* **32**, 4646[1].—The blood plasma of 22 healthy, young, White Leghorn cockerels was analyzed by oxidative micromethods and found to contain the following mean lipide values, in mg. per 100 ml. of plasma: total lipide 520, neutral fat 225, total fatty acids 361, total cholesterol 100, ester cholesterol 66, free cholesterol 34, phospholipide 155. In general, the amts. of the various lipides were proportionately related to the total lipide. J. W. Shipley

Antinarcotic substance in the normal serum of rabbits. Komao Ito. *J. Chosen Med. Assoc.* **29**, 2639–63(German abstr. 160–1)(1939).—The serum of the normal rabbit contains anticholoral hydrate (**A**) and anti-Mg (**B**) substances as tested with mice, but no anti-luminol (**C**). Normal serum plus anterior pituitary hormone (hypophorin) produces **C** effect. In serum of pregnant rabbits, **A** is still present, but not **B**, while **C** appears. The serum of the animals freed from sex, pituitary or thyroid glands loses all. If pinealectomized, the serum loses **B**, but **C** appears. Parathyroidectomy causes a loss of only **B**. When the reticulo-endothelial system is stimulated, the rabbit loses both **A** and **B**, but produces **C**, while with blockade of the system, all antinarcotic substances are lost. S. Tashiro

Electrolyte and water exchanges between mammalian muscle and blood in relation to activity. E. H. Wood, D. A. Collins and G. K. Moe. *Am. J. Physiol.* **128**, 635–52(1940). E. D. Walter

Uterine changes in the rabbit with the advent of pregnancy. Mark Graubard and Gregory Pincus. *Am. J. Physiol.* **128**, 653–61(1940).—Young female rabbits injected with pituitary exts. show an increase in the concn. of ascorbic acid in their pituitaries. Evidence is presented that the reducing substances of all the tissues tested (uterus, ovary, adrenal and pituitary) are composed of ascorbic acid and glutathione only. All these organs show in 3-day pregnant animals increased concns. of ascorbic acid and glutathione. The concns. then decline, reaching normal level by the 12th day. Uterine tissue contains very active concns. of cytochrome oxidase but extremely small amts. of cytochrome. The oxidase concn. of uterine tissue shows an increase on the 3rd day of pregnancy. During the remaining days it is only slightly higher than normal. The cytochrome oxidase of rabbit uteri is usually inactivated by washing tissue with water. E. D. Walter

Changes in the brain resulting from depletion of extracellular electrolytes. Herman Yannet. *Am. J. Physiol.* **128**, 683–9(1940).—Analyses of the serum and brains of animals whose extracellular electrolyte were depleted to varying levels are presented. The data indicate that the brain cells adjust to this depletion by releasing intracellular K in amts. proportional to the decrease in the concn. of extracellular Na. The data are consistent with the view that all the Na and probably all the Cl in the brain is diffusible. E. D. Walter

The antipressor action of renal extracts and their capacity to reduce the blood pressure of hypertensive rats. T. R. Harrison, Arthur Grollman and J. R. Williams, Jr. *Am. J. Physiol.* **128**, 716–24(1940).—Renal exts. were prepd. which had no significant effects on the blood pressure when given parenterally or orally to normal rats. The rats so treated showed, however, a marked diminution in the pressor response to renin when compared to control rats which did not have preliminary treatment with the pressor-free renal ext. The agent responsible for this effect is called the "renal antipressor substance." It inhibits not only the response to renin but also that of ephedrine and possibly reduces also the pressor effect of pitressin. Exts. contg. the renal antipressor substance cause declines in the blood pressure of hypertensive rats when given either parenterally or orally. Similar treatment does not alter the blood pressure of normal rats. E. D. Walter

Gastric carbonic anhydrase in dogs. Horace W. Davenport. *Am. J. Physiol.* **128**, 725–8(1940); cf. *C. A.* **33**, 1805[2]; **34**, 1043[2].—Carbonic anhydrase is present in high concn. in the parietal cells and in lower concn. in the cells of the surface epithelium of the gastric mucosa of the dog. It is probably not present in any other type of cell in the gastric mucosa. E. D. Walter

Effect of cortin after partial and complete hepatectomy. Hans Selye and Christiane Dosne. *Am. J. Physiol.* **128**, 729–35(1940).—Expts. on partially hepatectomized rats indicate that the decrease in the blood vol., blood chlorides and blood sugar caused by ablation of 85% of the liver tissue in fasted rats is inhibited by administration of an adrenal cortical ext., rich in the life-preserving principle. The decrease in blood sugar produced by complete hepatectomy is not significantly influenced even by large doses of cortin. E. D. Walter

The influence of postpituitary extract on the excretion of water and chlorides by the renal tubules. Herbert Silvette. *Am. J. Physiol.* **128**, 747–53(1940).—The expts. seem to indicate that the increased chloride excretion brought about by postpituitary ext. administration, like the decreased water excretion, is a renal and not a tissue phenomenon. The hypothesis is advanced that the antidiuretic hormone of the post-pituitary gland acts directly on the kidney, leading to a decreased tubular reabsorption of salt (chloride) coincident with the increased tubular reabsorption of water. E. D. Walter

The effect of endocrine extracts on the amino acids in the blood with incidental findings on the blood sugar and urea. Lee E. Farr and Louis K. Alpert. *Am. J. Physiol.* **128**, 772–81(1940).—The intravenous injection into dogs of the growth and metabolic factors of anterior pituitary ext., pitressin, antuitrin S, adrenal cortical hormone, testosterone propionate and thyroxine were each followed by marked increases in the concn. of amino acids in the blood plasma. The intraperitoneal injection of growth factor of anterior pituitary ext. produced a transient fall in plasma amino-acids. There were no consistent changes in blood sugar or urea. Subcutaneous injection of insulin and adrenaline, resp., produced sharp decreases in plasma amino acids with mutually opposite effects on the blood sugar. Changes in the plasma amino acids after insulin were not accompanied by corresponding change in the cell amino acids. E. D. Walter

Blood plasma protein production and utilization. The influence of amino acids and of sterile abscesses. S. C. Madden, C. A. Finch, W. G. Swalbach and G. H. Whipple. *J. Exptl. Med.* **71**, 283–97(1940).—When blood plasma proteins (I) are depleted by bleeding with return of the washed red blood cells (plasmapheresis) it is possible to bring dogs to a steady state of hypoproteinemia and a uniform I production on a basal low-protein diet. These dogs are clinically normal. Introduction of variables into their standardized life gives insight into the production of I. Casein retested as the basal protein in the ration may show high yield of I, equal to 33% of the protein fed. This equals the potency of liver protein (17–33%) and approaches the utilization of I by mouth (40%). Zein has no effect on I regeneration but when it is supplemented with cystine (II), tryptophan, lysine and glycine (III) there is a doubling of the liver basal I production and a retention of the fed protein N. Threonine does not modify the above reaction. Liver protein supplemented with II, leucine (IV), glutamic acid (V) and III in the basal diet

yields double the amt. of new-formed I compared with liver alone. This combination is then as potent as I itself when given by mouth—40% utilization. Tyrosine (VI) or lysine, arginine and isoleucine do not modify the above responses. Methionine is not as effective as II in supplementing gelatin and VI to produce I. II, IV and V appear to be of primary importance in the building of new I in these expts. I formation is dependent on materials coming from the body reserve and from the diet. Given an exhaustion of the reserve store there is very little I produced during a protein fast (3–6 g. per week). A turpentine abscess does not modify this fasting I reaction. Homologous plasma given by vein will promptly correct exptl. hypoproteinemia due to bleeding. It will maintain N equil. and replenish protein stores. Even during hypoproteinemia I may promptly pass out of the circulation to supply body needs for protein. Perhaps the most significant concept which derives from these expts. is the *fluidity* of the body protein (including I)—a ready give and take between the protein deposits—a "dynamic equil." of body protein. C. J. West

Isomeric *p,p'*-dihydroxy-3,4-diphenyl-*n*-hexenes [estrogenic activity] (Wessely, Kleedorfer) **10**. Synthesis and detn. of lipotropic activity of betaine hydrochlorides of *dl*-serine, *dl*-threonine and *dl*-allothreonine (Carter, Melville) **10**.

Urinary excretion of indoxyl (as indican) by infants with eczema. Herman Sharlit. *Arch. Dermatol. Syphilol.* **41**, 113–18(1940).—Detn. shows definitely increased excretion of indoxyl, probably because of intestinal stasis. Philip D. Adams

Blood iodine of patients with acne vulgaris. Eugene F. Traub and Richard Emmet. *Arch. Dermatol. Syphilol.* **41**, 506–8(1940).—The av. blood I of 22 apparently normal controls was 6 γ per 100 cc. Forty-five patients with acne vulgaris average 5.975. In a group of 45 patients with acne and 13 with miscellaneous cutaneous diseases, 25 males average 5.3 and 33 females average 6.65. Philip D. Adams

Advances in clinical chemistry. W. W. Hall and P. S. Gault. *U. S. Naval Med. Bull.* **38**, 1–27(1940).—The following methods are presented and discussed: sulfosalicylic acid method for the detn. of albumin in urine and protein in spinal fluid; phosphatase test for pasteurization; Weltman serum coagulation test; hippuric acid liver function test; Hehner test for HCHO in milk and cream; detn. of sulfanilamide and sulfapyridine in blood and body fluids; prothrombin coagulation test for vitamin K deficiency in jaundice and liver disease. Modifications of the hippuric acid test and Hehner test are presented. Philip D. Adams

Renal calcification in infancy and childhood. W. A. D. Anderson. *J. Pediat.* **14**, 375–81(1939).—Deposition of Ca in the kidney is of frequent occurrence in infancy and childhood owing to hypercalcemia, dystrophy or both. In 20 reported cases the Ca deposition was limited to the cortical region and involved tubules except in 4 patients who had received parathyroid ext. and Ca salts, where the Ca was also found in the small blood vessels. Renal damage, both clinically and at autopsy, was almost invariably found. Acute infection, intestinal obstruction, dehydration and acidosis were each present in a no. of cases and each seemed to be a factor of importance. Vitamin D administration was not an important factor in the cases reported. C. R. Addinall

Hyperparathyroidism, with death from parathormone intoxication. F. M. Hanes. *Am. J. Med. Sci.* **197**, 85–90(1939).—A case of hyperparathyroidism from parathyroid adenoma with fatal parathormone intoxication showed a characteristic type of parenchymatous renal calcification, and a blood Ca of 20 mg.%. B. C. P. A.

Mechanism of compensatory changes in anemia, especially as regards blood CO_2 and pH. F. L. Apperly and M. K. Cary. *Am. J. Med. Sci.* **197**, 219–29(1939).—In cases of increasing anemia the plasma CO_2 fell at first more rapidly and then more slowly. Whole-blood CO_2 and venous pH remained unchanged. The arteriovenous O, CO_2 and pH differences were little affected until the hemoglobin fell to about 40%, but thereafter fell rapidly. B. C. P. A.

Circulating blood volume in cardiac disease. B. Steinmann. *Arch. exptl. Path. Pharmakol.* **193**, 24–33 (1939); cf. *C. A.* **33**, 9343⁹.—Blood vol. was detd. by a spectrophotometric CO method. In cardiac disease the blood vol. was usually increased. There were marked variations in the CO concn. of blood in various parts of the body B. C. P. A.

Resorption of amyloid substance in man. D. B. I. Migounow. *Arch. intern. méd. exptl.* **13**, 437–47(1938).—Intravenous injection of staphylococci in rabbits results in amyloid production in the spleen, liver and kidney; the deposition is preceded by appearance of crystals in the liver only. Resorption of amyloid by giant cells occurred in the spleen of animals previously injected with antistaphylococcal vaccine. The amyloid in the neighborhood of the giant cells changed its chem. nature as shown by staining reactions. In a patient with hydatid cyst of the lung who died in spite of drainage of the cyst, amyloid was found in the spleen, liver, and kidney. It was undergoing resorption in the spleen and liver owing to the presence of giant cells. The resorption was attributed to the previous pus drainage. B. C. P. A.

Potential differences of lesions. C. Bartorelli. *Boll. soc. ital. biol. sper.* **14**, 209–10(1939).—The p. d. between injured and normal tissue does not occur in iodoacetate-poisoned muscle; hence lactic acid formation is a factor in the production of d. of lesions. B. C. P. A.

Nature of leucemic blood cells as determined by their metabolism. W. Kempner. *J. Clin. Investigation* **18**, 291–300(1939).—The metabolism of the blood cells from 15 patients with lymphatic leucemia and 40 patients with myelogenous leucemia was detd. by the Warburg method (cf. *C. A.* **26**, 1661). Myeloblasts as well as lymphoblasts, in contrast to the more mature cells, have a purely oxidative metabolism and do not form lactic acid under aerobic conditions. B. C. P. A.

Relation between stomach and kidneys. C. Dienst. *Klin. Wochschr.* **18**, 541–4(1939).—9 patients with renal disease showed high gastric acidity and normal nonprotein N in blood; 11 other patients had low values for gastric HCl, and 7 of these showed raised nonprotein N values. B. C. P. A.

Serum potassium and sodium in pre-eclamptic conditions. F. Posatti and W. Beiglböck. *Mschr. Geburtsh. Gynäk.* **108**, 237–46(1938).—Serum K and Na in pre-eclamptic conditions are normal; if insulin is given serum K decreases and Na increases. B. C. P. A.

Attempt at immunization with some paravenins. A. Arthus, M. Provoost and G. S. de Sacy. *Ann. physiol. physicochim. biol.* **15**, 776–84(1939).—Cobra venin was immediately detoxified by $KMnO_4$ but not by H_2O_2, KIO_3, $K_2Cr_2O_7$ or K_2CrO_4. Cobra venin which had been dild. with an equal vol. of 0.05 *N* NaOH, KOH or $Ca(OH)_2$ and allowed to stand for 12 hrs. was still toxic when neutralized and injected into rabbits. If the concn. of the alkalies was higher or the period of contact longer, the detoxification of the venin was very pronounced; only NH_4OH was inactive. Whether an alkali or an alk. salt is used, the speed of detoxification depends on the alky. The detoxification of cobra venom reported by Binet, Weller and Robillard (*C. A.* **33**, 8796⁹) is attributed to the alky. produced by the Na_2PO_4 and not to the action of the glutathione. Modified venin was prepd. by treating cobra venin with $KMnO_4$ (1:1000) for 1/4 hr. at room temp. or with 0.025 *N* $Ca(OH)_2$ for 7 days. Rabbits were given 8 subcutaneous injections of 0.25 mg.

modified venin in 2 cc. physiol. saline soln. at 5-day intervals (total amt. of modified venin = 2 mg.); 15 days after the last injection 2 mg. non-transformed venin was injected intravenously. Rabbits prepd. with venin + $KMnO_4$ showed a slight immunity, while those prepd. with venin + $Ca(OH)_2$ had an unquestionable immunity. A similar expt. using a total of 0.5 mg. each of modified and of original venin was performed on guinea pigs. The immunity of the guinea pigs prepd. with venin + $Ca(OH)_2$ was superior to that of the animals prepd. with venin + $KMnO_4$. Ruth Berggren

The mechanism of anaphylactic shock. Conceptions of the part played by diastase in anaphylaxis. Jean L. Parrot. *Ann. physiol. physicochim. biol.* 15, 903–11 (1939); cf. *C. A.* 33, 3868[8].—The formation of histamine by diastase during shock has not been demonstrated exptly. During sensitization histamine does not accumulate in the tissues to form a supply available at the time of reinjection. As a working hypothesis it is suggested that the intracellular antigen-antibody reaction is followed by cytological modifications which permit the release from the cells of certain normal constituents including antithrombin and histamine. Ruth Berggren

Electrical activity of cerebral cortex in insulin hypoglycemia and in different conditions modifying the metabolism of the centers. Giuseppe Moruzzi. *Arch. intern. physiol.* 48, 45–101(1939); cf. *C. A.* 33, 2211[9]. C. L. B.

Electrical double layer and virus stability. Arthur S. McFarlane. *Trans. Faraday Soc.* 36, 257–64(1940).—The stability of protein suspensions, of cells and bacteria and of viruses is discussed. Electrophoresis expts. on the Bushy stunt virus are described. The surface of the vaccinia body does not seem to be delimited by a semipermeable membrane. The stability of the virus toward lipoid solvents precludes the existence of the familiar type of semipermeable membrane which is based on a lipoid-protein duplex film. When spread on a water surface the virus particles are not significantly deformed. Virus sedimentation measurements in electrolytes at 0.01 to 0.001 *M* show a high ζ-potential and that the ion atm. must extend a considerable distance from the surface of the virus. In dil. salt solns. relatively enormous amts. of water are assocd. with the virus particle. Victor R. Deitz

Gastric analyses and gastric symptoms in diabetes insipidus. Harry Blotner. *Am. J. Digestive Diseases Nutrition* 7, 73–5(1940).—Gastric analyses in 6 patients showed greater vol., acidity and pepsin and rennin contents than in normal subjects. These high levels were decreased by pituitrin administration. E. Eagle

An abnormal mechanism for the excitation of gastric secretion in the dog. A. C. Ivy and W. H. Bachrach. *Am. J. Digestive Diseases Nutrition* 7, 76–8(1940).—The authors advance the hypothesis that hypersecretory response to a meal or a hypercontinuous secretion of gastric juice may be due to an elaboration of histamine by an irritated or inflamed mucosa. Edward Eagle

Sensitization of rabbits to uveal tissue by the synergistic action of staphylotoxin. Hugo Lucic. *Arch. Ophthalmol.* (Chicago) 22, 359–69(1939).—Repeated intracutaneous injections of bovine uveal tissue toxin produced hypersensitivity to swine, rabbit and autogenous uveal pigment in 6 of the 22 rabbits used. E. Eagle

The effect of severe hemorrhage on the concentration of copper in the blood of sheep. A. T. Dick. *Australian J. Exptl. Biol. Med. Sci.* 17, 271–4(1939).—Contrary to the observations of others on the rabbit, pigeon, goose and dog that the concn. of Cu in the blood rises severalfold after severe hemorrhage, D. found that in the sheep the anemia resulting from the loss of large vols. of blood (up to 25 ml. of blood / kg. body wt.) is not followed by any disturbance of the concn. of the Cu in the blood. Edward Eagle

Passive immunity in experimental pertussis. E. A. North, E. V. Keogh, G. Anderson and Stanley Williams. *Australian J. Exptl. Biol. Med. Sci.* 17, 275–84(1939).—Demonstration is made of antibody protecting mice against infection with *H. pertussis* injected intranasally under anesthesia. This protective antibody is found in the serum of adult contacts of whooping cough, of children convalescent from whooping cough, of children immunized with *H. pertussis* (Phase I) and in rabbits immunized with living cultures of *H. pertussis*, both virulent (Phase I) and avirulent (Phase III) strains. The protective antibody is antibacterial in its action. There is no correlation between Phase I agglutinin titer and the protective potency of serums. Edward Eagle

The serology of the tobacco mosaic virus. I. The agglutination reaction with homologous antiserums. Nancy Atkinson. *Australian J. Exptl. Biol. Med. Sci.* 17, 333–43(1939).—No marked difference was observed between the behavior of the purified virus prepn. and the crude virus in a wide range of const. antibody and const. antigen tests. With both antigens, however, serological tests showed the following features: The const. antibody optimal ratio depends on the concn. of serum, but the const. antigen optimal ratio was const. over a wide range of antigen concns., the 2 optimal ratios differing markedly. Dialysis of the antiserum did not affect the const. antibody test, but interfered with the const. antigen test. Solns. of antibody-globulin obtained from antiserum behaved like whole serum in the const. antibody test, and like dialyzed serum in the const. antigen test. Edward Eagle

Subgroups of agglutinogen B [in blood]. R. Dujarric de la Rivière and N. Kossovitch. *Compt. rend. soc. biol* 132, 415–17(1939).—Discussion. The separn. of agglutinins β_1, β_2 and β_3 from bloods is described. L. E. Gilson

Presence of neutralizing antibodies in the cerebral tissue of animals inoculated [intracerebrally] with vaccine virus. J. Vieuchange and F. Galli. *Compt. rend. soc. biol* 132, 423–5(1939). L. E. Gilson

Phenomena of neutralization of vaccine virus by an antiserum, and passive immunity, studied in vitro. J. Vieuchange and L. Stamatin. *Compt. rend. soc. biol.* 132, 426–9(1939). L. E. Gilson

Appearance of mammary carcinoma in mice treated with estrone plus doses of testosterone fifty times as great. A. Lacassagne and A. Raynaud. *Compt. rend. soc. biol.* 132, 431–4(1939); cf. *C. A.* 32, 7995[9]; 33, 7382[1].—Male mice were treated with 50 γ estrone benzoate plus 1.0–2.5 mg. testosterone propionate per week. The hypophysis, adrenals and genital tract remained normal but some developed mammary adenocarcinomas. Females treated in the same manner developed intersexual characteristics and some developed mammary tumors after a long delay. L. E. Gilson

Adsorption of the antibodies, of serums of horses prepared with [human] nitroserum and diazoserum, by nitrostromas and diazostromas prepared from sheep erythrocytes. W. Mutsaars. *Compt. rend. soc. biol.* 132, 467–9(1939); cf. *C. A.* 33, 1383[8].—Both stroma prepns. adsorbed the antibodies from the serums. L. E. Gilson

Action of benzaldehyde on the antigenic properties of horse serum. W. Mutsaars and J. Robert. *Compt. rend. soc. biol.* 132, 469–72(1939).—Horse serum was shaken with BzH, then injected into a group of rabbits. All the antiserums obtained gave precipitin reactions with normal and BzH-treated horse serum, and some also gave reactions with normal serums from man and all the common exptl. animal species. Antiserums from rabbits injected with horse serum treated with phenylacetaldehyde, phenylpropionic aldehyde, cinnamic aldehyde, furfural and salicylaldehyde gave reactions only with horse serum. L. E. Gilson

Comparative absorption of ferrous chloride in different pathological states. H. Cosyns. *Compt. rend. soc. biol.* 132, 472–5(1939); cf. *C. A.* 33, 4654[1].—The subjects were given 225 mg. Fe, as $FeCl_2$, by mouth. In normal subjects and patients with pernicious anemia absorption of the Fe was slight, while in cases of hemorrhagic anemia and hypochrome anemia with achylia the absorption was very marked. L. E. Gilson

Antihemolytic properties of the serum of newborn infants. Pierre Van Rossum. *Compt. rend. soc. biol.* 132,

475–8(1939).—*In vitro*, the plasma of newborn infants has a much weaker antihemolytic protective power, with respect to lysocithin, than plasma of adults. L. E. G.

Concentration and detection of a dye in abscesses. H. Kroll, Siegfried F. Strauss and H. Necheles. *Proc. Soc. Exptl. Biol. Med.* 43, 228–34(1940).—When injected intravenously the bisazo dye T1824 (Evans blue) is selectively fixed by abscess tissue (cf. *C. A.* 33, 2872[4]). After substitution of 1 atom of Br in the dye it is still localized in abscesses and the amt. present can be estd. by detg. the Br content of the tissue. If 2 or 4 atoms of Br are substituted in the dye localization is less selective and some is fixed by the liver, kidneys and spleen. L. E. G.

Specific action of an antiserum for placental proteins on placenta and normal progress of pregnancy. Harold R. Cohen and A. J. Nedzel. *Proc. Soc. Exptl. Biol. Med.* 43, 249–50(1940).—An antiserum for full-term guinea-pig placentas reacted with liver and kidney autolyzates. These precipitins were removed by absorption *in vitro*. The serum still reacted strongly with placental autolyzates. Injection of this serum into pregnant guinea pigs caused them to abort. The blood serums of 2 women known to be habitual aborters gave pos. precipitins with proteins prepd. from full-term human placentas. L. E. Gilson

Effect of estrogens and androgens on growth of mammary fibroma in rats. Frederic E. Mohs. *Proc. Soc. Exptl. Biol. Med.* 43, 270–2(1940).—Transplantability and growth rate of a pure mammary fibroma were markedly enhanced by physiol. levels of injected estrogens in the host rats. Physiol. levels of androgens had no such effect The tumor-stimulating effect of estrogens was greater in male castrates than in female castrates. With onset of malignancy the connective tissue tumors lost their responsiveness to hormones. L. E. Gilson

Potassium as a toxic factor in intestinal obstruction. Myron N. Jorgensen, Nicholas Dietz and Frederick C. Hill. *Proc. Soc. Exptl. Biol. Med.* 43, 282–7(1940).—Results of a large no. of dog expts. indicate that hyperpotassemia cannot be considered as a contributing factor to the cause of collapse and death in exptl. intestinal obstruction. L. E. Gilson

Allergic reactions to an antigen from the chigger, Trombiculum irritans. Arch Sherrod Morrow. *Proc. Soc. Exptl. Biol. Med.* 43, 303–5(1940).—An antigen was prepd. by grinding chiggers and extg. with distd. water. Only certain individuals gave a pos. skin reaction. A passive transfer gave pos. results. Heat destroys a portion of the antigen and makes it less irritating. L. E. Gilson

Acute circulatory failure (shock) following subcutaneous injection of hypertonic sodium chloride solution. Harry A. Davis. *Proc. Soc. Exptl. Biol. Med.* 43, 354–7(1940).— The subcutaneous injection of 25 cc./kg. of 25% NaCl soln. in dogs is followed by acute circulatory failure, assocd. with hemoconcn. and an increase in the sugar, nonprotein N and NaCl of the blood. **Relative significance of water and protein loss in dehydration shock.** *Ibid.* 357–9.—Shock which follows subcutaneous injection of hypertonic NaCl soln. is due to loss of fluid from the blood into the NaCl soln. This fluid contains very little protein. L. E. Gilson

Prolonged maintenance of a mammary carcinoma in vitamin E-deficient rats. W. Lamar Bryan and Karl E. Mason. *Proc. Soc. Exptl. Biol. Med.* 43, 375–9(1940).—Maintenance of the Walker 256 mammary carcinoma in vitamin E-deficient rats for 2½ yrs. by 22 successive implantations, produced no apparent alteration in the rate of growth, transplantability, histologic organization or cytologic characteristics of the tumor. Normal rats fed concentrates of wheat-germ oil failed to show the neoplastic growths observed by Rowntree and associates (*C. A.* 32, 3012[3]). L. E. Gilson

Whealing response of human skin to ultraviolet light, and the histamine theory of allergic reactions. Harold A. Abramson. *Proc. Soc. Exptl. Biol. Med.* 43, 410–12 (1940).—Preliminary. The observations do not support the view that histamine or a readily diffusible H-substance of low mol. wt. is responsible for the skin response to ultraviolet irradiation. L. E. Gilson

Determination of pneumococcal capsular polysaccharide by photonreflectometric titration of precipitation with excess antibody. Samuel C. Bukantz and Jesse G. M. Bullowa. *Proc. Soc. Exptl. Biol. Med.* 43, 418–22 (1940).—Preliminary. L. E. Gilson

An electrophoretic study of tetanus antitoxin serums. J. Van der Scheer and Ralph W. G. Wyckoff. *Proc. Soc. Exptl. Biol. Med.* 43, 427–8(1940); cf. *C. A.* 33, 9432[8].—Results are shown graphically. L. E. Gilson

The differential diagnosis of chronic arthritis in bovines. J. G. van der Wath. *J. S. African Vet. Med. Assoc.* 10, 91–102(1939).—At least 3 major diseases (contagious abortion, chronic arsenical poisoning and P deficiency) are responsible for chronic arthritis in bovines in S. Africa. As shown by analyses of numerous samples, the blood of cattle and the grass and soil along parts of the coastal belt of the Transkei and Tsitsikei and in the district of Umtata are very low in P and aphosphorosis of cattle is common, especially in parts of the coastal belts of Flagstaff and East London districts. Chronic arsenical poisoning is likely to occur wherever extensive and heavy spraying operations of As have been conducted during locust-control campaigns. K. D. Jacob

Caries: a new theory of the cause. Paul Pincus. *Illinois Dental J.* 9, 80–8(1940).—The importance of the org. compds. in the enamel is stressed in relation to dental caries. H. M. Leicester

Hyaluronic acid in the pleural fluid associated with a malignant tumor involving the pleura and peritoneum. Karl Meyer and Eleanor Chaffee. *J. Biol. Chem.* 133, 83–91(1940); cf. *C. A.* 34, 1381[1].—The viscous component of a pleural fluid assocd. with a malignant tumor of the pleura and peritoneum has been isolated and shown to be hyaluronic acid, similar in compn. and rotation to this polysaccharide obtained from other sources. The viscosity of the tumor fluid was about 95 times greater than that of the isolated polysaccharide in an equiv. concn., dropping sharply on dilu. The fluid is characterized as a gel formed by the polysaccharide acid and the copresent protein. It is tempting to speculate that in malignant tumors hyaluronic acid or similar constituents may prevent the normal restraining influences of the host tissues, so that the inherent growth tendencies of the tumor tissues become dominant. A. P. Lothrop

Anaphylactic shock and nitrogen metabolism in the dog. Leon L. Miller. *J. Biol. Chem.* 133, 93–101(1940).—Anaphylactic shock in dogs results in increased urinary N excretion which parallels in severity the clinical symptoms of the shock. This response is strictly comparable with that resulting from very obvious tissue injury and substantiates the view that anaphylactic shock may be marked by tissue injury of considerable severity. There is also an increased creatine and uric acid excretion, a finding which supports the contention that both muscle and liver tissue undergo injury in anaphylactic shock. A. P. Lothrop

Gout and rheumatism. K. Sedláček. *Acta Rheumatol.* No. 43, 5–14(1939).—A substance from the froth of urine belonging to the stalagmon group (cf. Bechhold and Reiner, *C. A.* 15, 261, 1562) is isolated by adsorption in benzine emulsion and sepd. after other stalagmons are hydrolyzed by electrolysis and crystalloids removed by dialysis. Given subcutaneously in physiological saline it causes rapid improvement of gouty and other arthritic symptoms. S. believes it to be a colloid of a protein nature liberated from inflammative foci, acting as an enzyme and preventing colloidal stabilization of urates. The mechanism of healing effect is believed to be that of active immunity. J. McAfee

Lymphoid tumors in mice receiving estrogens. W. U. Gardner, A. Kirschbaum and L. C. Strong. *Arch. Path.* 29, 1–7(1940).—15.4% of 149 C_3H-strain mice injected with estrogens (estradiol dipropionate, estradiol benzoate, equilin benzoate, cholesterol, cholesterol benzoate, carotene, testosterone propionate, the last and estradiol benzoate simultaneously) develop leucemia or nonleucemic lymphoid tumors. None of 117 uninjected

rats and 1 of 86 briefly treated mice of the same strain develop lymphoid tumor. J. McAfee

Production of internal tumors with chemical carcinogens. H. P. Rusch, C. A. Baumann and G. L. Maison. *Arch. Path.* 29, 8–19(1940).—3,4-Benzopyrene or 1,2,5,6-dibenzanthracene injected into internal organs of mice and rats give rise to tumors at the site of injection. Injection into bone marrow does not change the blood picture. Feeding of crude wheat-germ oil does not give rise to tumors. J. McAfee

Chemistry of atherosclerosis. I. Lipide and calcium content of the intima and of the media of the aorta with and without atherosclerosis. Sidney Weinhouse and Edwin F. Hirsch. *Arch. Path.* 29, 31–41(1940).—The lipide and Ca of human aortic media increase with age, not in relation to intimal atherosclerosis. Combined cholesterol increases absolutely and relatively to the free. Ether-insol. phosphatide (sphyngomyelin) increases much more than ether-sol. decreases, and galactoside values parallel the former. Intima free of gross deposit contains more lipide and less Ca than media. As atherosclerotic intimal lesions become more severe the free / combined cholesterol ratio increases until necrosis sets in; after that it declines. Ether-sol. phospholipide decreases, ether-insol. increases while the total remains const. Neutral fat-fatty acid and galactoside decrease. High Ca is found after onset of fibrous thickening. Partition of lipide constituents of early intimal lesions closely resembles that of blood plasma. J. McAfee

Phosphocreatinemia in uremia. A. Grunberg. *Rev. méd.* 56, 382–6(1939).—A discussion. The value of detg. phosphocreatine in the blood as a test for renal sufficiency is questionable. A. E. Meyer

Determination of the codehydrogenases I and II (cozymase) in the blood of diabetic patients in severe acidosis. Richard W. Vilter, Sue Potter Vilter and Tom D. Spies. *Am. J. Med. Sci.* 197, 322–6(1939); cf. *C. A.* 33, 5482⁷.—The blood of diabetic patients with severe acidosis supports growth of influenza bacilli less effectively than blood from a normal person or from the same diabetic patient when regulated or given nicotinic acid. Codehydrogenase I (cozymase) added to such deficient blood or to autoclaved media without blood supports luxuriant growth, although nicotinic acid amide shows no such stimulation. Conclusion: Codehydrogenase I is deficient in the blood of diabetic patients in severe acidosis and the hypothesis is supported that the therapeutic effect of nicotinic acid depends on the synthesis in the body of nicotinic acid nucleotide and finally of a codehydrogenase. Ferrin B. Moreland

Studies in diabetes mellitus. VII. Nondiabetic glycosuria. Alexander Marble, Elliott P. Joslin, Louis I. Dublin and Herbert H. Marks. *Am. J. Med. Sci.* 197, 533–56(1939).—Of 14,000 cases of glycosuria seen between 1900 and 1935, about 2,000 were diagnosed as nondiabetic. Of these, 10% later developed diabetes, usually mild. No case of true renal glycosuria progressed to diabetes. Both among those becoming diabetic and those remaining nondiabetic, the incidence of deaths from cardiovascular and renal diseases was strikingly high. The incidence of *cancer* as a cause of death was 5 times as high in the nondiabetic as in the diabetic group. In the absence of complications, nondiabetic glycosuria seems to exert little or no influence on length of life. Diagnostic standards and procedures, particularly as regards *sugar-tolerance tests*, are discussed. Four cases of *pentosuria* and one of *fructosuria* were found. Ferrin B. Moreland

Chemical changes in the blood of patients with pyloric obstruction. Paul H. Noth and Dwight L. Wilbur. *Ann. Internal Med.* 13, 1285–96(1940).—There is a pos. correlation between the amt. of vomiting and the decreased plasma chlorides, increased blood urea, and increased CO_2-combining power of the blood. No correlation could be seen between the above 3 factors and type of lesion, age of the patient, the amt. of retained gastric content, the concn. of free HCl in the gastric content or any combination of these factors. The decrease in plasma chlorides seems due to loss of chlorides by vomiting. As a rule patients with achlorhydria show similar blood chem. findings to those with pyloric obstruction although HCl is present in the latter. Quant. studies or the metabolism of Na, Cl, N and bicarbonates will be necessary to explain these changes. John T. Myers

Oil aspiration pneumonia and pneumolipoidosis. Philip G. C. Bishop. *Ann. Internal Med.* 13, 1327–59(1940).—Final diagnostic proof is obtained by chem. analysis of the oil or lipoid in the involved lung tissue with identification of the offending agent. 107 references. J. T. M.

A case of acute idiopathic hematoporphyria with acute ascending paralysis. Harold W. Palmer. *Ann. Internal Med.* 13, 1500–8(1940).—12 references. J. T. M.

Xanthoma of tendon sheaths and synovial membranes. A clinical and pathologic study. John D. B. Galloway, Albert C. Broders and Ralph K. Ghormley. *Arch. Surg.* 40, 485–538(1940).—Xanthoma in these locations is assocd. primarily with an alteration in the lipoid metabolism, secondarily set off by trauma, infection or both. It is classified under the head of primary essential xanthomatosis. 139 references. John T. Myers

The histamine content of organs in white mice. J. Martin and A. Valenta. *Arch. exptl. Path. Pharmakol.* 193, 305–7(1939).—The histamine content of organs of white mice is no different from that of other lab. animals. Consequently, the superior shock resistance of white mice is not due to the small concn. of histamine, but to their resistance to biol. anaphylactic substances. J. Pinchack

Effect of sensitization on the response of guinea pigs and rats to histamine, choline and acetylcholine. J. Martin and S. Went. *Arch. exptl. Path. Pharmakol.* 193, 308–11(1939).—Sensitization increases the choline effect on the isolated guinea-pig heart 400- to 500-fold. It has no effect on the reactivity of blood pressure, bronchial muscles and isolated hearts to histamine or acetylcholine. J. Pinchack

Antithyroglobulin and antithyroxine. S. Went, K. Piribauer and L. Kesztyüs. *Arch. exptl. Path. Pharmakol.* 193, 312–24(1939).—Prolonged parenteral administration of thyroglobulin (I) markedly decreases O consumption in white rats or guinea pigs, even after subcutaneous injection of thyroxine (II). More than 15 g. II is necessary to increase O consumption under these conditions. I probably acts as a chemospecific antigen, since normal animals passively immunized with serum of animals treated with I are capable of inhibiting the metabolic action of II. Rabbits show a definite increase in metabolism after I injection and a further rise in O consumption after addnl. II. J. Pinchack

The effect of various bacterial toxins on Jensen tumors in rats. V. Baroni. *Arch. roumaines path. exptl. microbiol.* 11, 125–42(1938) (in French).—Streptococcal and gonococcal toxins have an unspecific antitumorigenic action in rats when injected prior to grafting on Jensen tumors. The mortality is greater if injections, which are of themselves very toxic, are made after grafting. J. Pinchack

Synthetic immunochemistry. IV. Further investigation of *O*,β-glucosidotyrosyl derivatives of proteins. J. H. Humphrey and M. E. Yuill. *Biochem. J.* 33, 1826–32 (1939); cf. *C. A.* 32, 9255⁴.—The techniques of complement fixation and bulk pptn. were used to confirm and extend the previous observations on the immunological properties of the *O*-β-glucosido-*N*-carbobenzyloxytyrosyl derivs. of gelatin and insulin. The results indicated that the carbobenzyloxy group has a hapten function and that *N*-carbobenzyloxytyrosyl gelatin behaves as a full antigen. E. W. Scott

H—PHARMACOLOGY

CARL F. SCHMIDT

A preliminary note on the anthelmintic efficiency of phenothiazine against Trichostrongylus spp. in sheep, Hugh McL. Gordon. *J. Council Sci. Ind. Research* 12. 345–7(1939).—Phenothiazine, in the form of Thiox, in doses of 0.6 g. per kg. of body wt., administered in capsules, showed a very high degree of efficiency against *Trichostrongylus* spp. in sheep. Doses of 0.3 g. reduced this efficiency and it was greatly reduced when the dosage was dropped to 0.15 g. Phenothiazine was equally efficient whether administered in capsules or as a powder shaken up in Cu sulfate soln. J. R. Adams

The tissue concentration of bismuth in man. Julius R. Scholtz and Albert L. Chaney. *Am. J. Syphilis, Gonorrhea, Venereal Diseases* 23, 759–70(1939).—A study of the toxicology of Bi and its distribution in the tissues after clinical treatment with Bi compds. Philip D. Adams

Pathological changes in rats and in dogs fed diets containing lead and arsenic compounds. L. L. Finner and H. O. Calvery. *Arch. Path.* 27, 433–46(1939); cf. *C. A.* 33, 1815[4].—Pb arsenate and acetate, As_2O_5 and $Ca_3(AsO_4)_2$ were used. The kidneys of all dogs which had been on diets with Pb up to the time of death showed tubular degeneration. The bones of many were hard, brittle and thickened, with constricted marrow cavities. In the As-treated animals there was generalized dilatation of the capillaries in the viscera and parenchymatous degeneration of the liver. The bone marrow was slightly hyperplastic. The Pb was the more potent poison and some dogs fed as little as 0.33 mg. of Pb per kg. died. (3 photomicrographs.) B. C. P. A.

Sympatholytic effect of ergotamine. F. Guercio and M. Pezzini. *Boll. soc. ital. biol. sper.* 13, 1115–16(1938); cf. *C. A.* 33, 8788[3].—In dogs and rabbits, ergotamine increases arterial pressure and weakens or reverses the hypertension due to stimulation of the hypogastric, or central end of the cut vagus; even large doses do not abolish the hypertension due to adrenaline. After hypogastric stimulation of the uterus (rabbit), relaxation is induced only by direct injection of ergotamine into the internal iliac artery, the corresponding vein being ligatured. Parts of the sympathetic nervous system are thus sensitive to ergotamine and others insensitive. B. C. P. A.

Ammonium chloride and lime injuries to the eye. G. C. Pether. *Brit. Med. J.* 1939, I, 668–70.—NH_4Cl soln. (4%) was successfully used in the treatment of eye injuries caused by CaO; it is more efficient and no more painful than other irrigating fluids. B. C. P. A.

Role of pressor substances in treatment of arsenic shock. J. Kucharik. *Magyar Orvosi Arch.* 39, 613–20(1938).—Cats (dial) were given 7 mg. of As_2O_3 per kg. intravenously. When a low level of blood pressure was reached, various drugs were injected. Adrenaline consistently increased blood pressure, and in small repeated doses doubled the life period. Ephedrine, pituitrin and $CaCl_2$ were ineffective. B. C. P. A.

Comparison of the changes provoked by insulin in the lipide and glycogen contents of the liver with those produced by the administration of large quantities of glucose in the absence of insulin. P. Cristol, L. Hédon, A. Loubatières and P. Monnier. *Ann. physiol. physicochim. biol.* 15, 820–3(1939); cf. *C. A.* 33, 220[6], 735[2], 5066[3].—Arguments are given in favor of the hypothesis that the inverse modifications of the glycogen and lipide contents of the liver under the influence of insulin result from the direct intervention of this hormone in the metabolism of the liver cells. A completely depancreatized dog was treated with insulin until fully recovered, then deprived of insulin for 5 days. In spite of a fast of 40 hrs. the diabetes was severe and the urinary D/N ratio 2.8. After the injection of 136 g. glucose with the simultaneous ingestion of 70 g. glucose, the glycogen and total lipides in the fresh liver tissue rose from 0.15 and 10.47%, resp., to 1.05 and 15.52%, resp., while the blood sugar rose from 0.388 to 1.306%. Ruth Berggren

Action of yeast extracts on the carbohydrate metabolism. J. Ledrut. *Ann. physiol. physicochim. biol.* 15, 865–8 (1939).—*Prepn. of yeast ext.* (I): The yeast cells were destroyed with CO_2 snow and the product ground with sand. The mixt. was extd. with alc. and filtered. The filtrate was distd. *in vacuo* and the fat removed by extn. with anhyd. ether free from peroxide. The insol. portion was treated with 75% alc. and centrifuged; this process was repeated until the alc. remained colorless. The alc. solns. were combined and abs. alc. added to ppt. the insulin-like substance as a sirupy mass. The mixt. was centrifuged and the ppt. dissolved in water and purified by pptn. with $(NH_4)_2SO_4$ by the method of Simola (*C. A.* 22, 436). The ppt. was converted into the picrate and then the hydrochloride by the method of Dudley (*C. A.* 18, 3399). The product (I), after washing with alc. and with ether, was a yellow, H_2O-sol. powder. It was kept in the cold. Intrasaphenous injections of 2 mg. I/kg. into dogs produced a distinct lowering of the blood sugar, the max. occurring in about the 5th hr. The blood sugar in a rabbit decreased from 130 to 77 mg. % 7 hrs. after the administration of 100 mg. I/kg. The oral administration of 6 mg. I/kg. to dogs caused a slight, variable reduction in the blood sugar. Ruth Berggren

Sensitization to potassium ions by veratrine. Z. M. Bacq. *Ann. physiol. physicochim. biol.* 15, 948(1939); cf. *C. A.* 33, 5913[8]; 34, 527[2]. Ruth Berggren

Prolonged treatment of the depancreatized dog with protamine zinc insulin. Irreversible nervous disturbances during this treatment. (Demonstration with a cinematographic film.) L. Hédon and A. Loubatières. *Ann. physiol. physicochim. biol.* 15, 961(1939); cf. *C. A.* 33, 744[6,8], 5503[1].—A note on a film showing the excellent general condition of completely depancreatized dogs, in which the diabetes is fully controlled by a single daily injection of protamine Zn insulin, as well as the typical phases of severe, irreversible, hypoglucemic symptoms induced by excessive doses of this insulin. R. B.

The influence of echitamine on the hypertension and renal vasoconstriction produced by adrenaline. Raymond-Hamet. *Compt. rend.* 209, 1013–15(1939); cf. *C. A.* 28, 6481[3].—Two successive injections of 8 mg. echitamine-HCl/kg. into a dog distinctly increased both in amplitude and duration the renal vasoconstriction produced by 0.02 mg. adrenaline and intensified and prolonged the adrenaline hypertension. Five injections of echitamine-HCl, totalling 256 mg./kg., lowered and prolonged the adrenaline hypertension and caused a marked dilatation in renal vol. after an initial, very slight vasoconstriction. In moderate doses echitamine has a definite sympathicosthenic action, in very high doses a minor sympathicolytic action. Ruth Berggren

The fate of copper in the blood stream. Alfred Eden and H. H. Green. *J. Comp. Path. Therap.* 52, 301–15 (1939).—The min. lethal dose of Cu injected intravenously as sulfate is about 1.5 mg. per kg. body wt. for the rabbit and below 2 mg. for the sheep. Administered in soln. by stomach tube 50 mg. per kg. is a borderline toxic dose for the rabbit. After intravenous injection of $CuSO_4$ into rabbits and sheep, the immediate rise of blood Cu is followed by rapid distribution over the tissues, and almost normal values are approached within 5 hrs. of a nonfatal injection. The Cu content of cells and plasma in normal blood of sheep and cattle is approx. the same. After injection of $CuSO_4$ the plasma Cu level is at first higher than that of the whole blood and the rate of disappearance from plasma is higher. After equil. is established between cells and plasma the rate of disappearance is the same for both. After very large doses of $CuSO_4$ the rate of fall for plasma is at first faster and then slower than for whole blood. When high doses of $CuSO_4$ are given in soln. by stomach tube the blood Cu rises to levels representing the balance between rate of absorption into the blood and rate of disappearance from it. No significant rise occurs if the soln. is previously dried on food. The upper level of nonfatal blood Cu lies between 1.2 and 1.6 mg. % for the rabbit and is somewhat lower for the sheep. Rachel Brown

Pervitin as a means of increasing efficiency. O. Leh-

mann, H. Straub and A. Szakáll. *Arbeitsphysiol.* 10, 680–91(1939).—With 3 men, 21–26 yrs. old, observations were made during rest and work (bicycle ergometer) of body temp., pulse rate, blood pressure, ventilation rate, O_2 consumption, and R. Q., with and without 5–15 mgs. Pervitin (1-phenyl-2-methylaminopropane). In some expts. the subjects worked with const. load and speed, in others with automatically increasing load, until exhausted. No changes in metabolism were observed after Pervitin administration either during rest or work. At times considerably more work was performed with, than without, Pervitin. After work continued to exhaustion, the efficiency was lowered considerably more when the subjects had received Pervitin than when they worked without it. The subject without Pervitin discontinued work shortly before reaching the limit of max. O_2 absorption, whereas the subject with Pervitin could work to the limit of max. efficiency. For workmen and sportsmen working to the limit of capacity, Pervitin is dangerous because it suppresses the subjective limits of exhaustion and leads to consumption of reserves of strength normally retained by the organism as protection against too great exhaustion. T. M. Carpenter

Influence of Pervitin on some psychic and psychomotor functions. O. Graf. *Arbeitsphysiol.* 10, 692–705(1939). —With 4 men (2 of them blind) a study was made of psychic and psychomotor functions during mental arithmetic, stringing of pearls, and riding a bicycle ergometer, with and without doses of 9–15 mg. of Pervitin (1-phenyl-2-methylaminopropane). For comparative purposes, the observations with and without Pervitin were made on the same day. The Pervitin eliminated the feeling of fatigue and inhibitions and led to increased activity and feeling of efficiency. It lessened the ability to concentrate, but acted favorably on efficiency because it lowered the too high tension of attentiveness which, with fine work, leads to disturbance in bodily movements. Marked euphoria was lacking. The effect of Pervitin is variable and seems to depend considerably on the initial condition under which it is given. Pervitin combined with caffeine has a potent effect in increasing the stimulus to an unpleasant degree. Graf cautions against the use of Pervitin except when specially indicated. T. M. C.

Aberrant action of sodium (1,3-dimethylbutyl)ethylbarbiturate. Edward E. Swanson and K. K. Chen. *Quart. J. Pharm. Pharmacol.* 12, 657–60(1939).—This compd. causes convulsions in mice, rats, guinea pigs, rabbits, cats, dogs and monkeys but depression and anesthesia in frogs and toads. The convulsant action in rabbits may be suppressed by the hypnotic action of Na amytal, although the substance is not detoxified by the latter. Seven references. W. O. E.

Influence of general anesthetics on adrenergic transmission. C. S. Jang. *Quart. J. Pharm. Pharmacol.* 12, 661–76(1939).—Expts. were made on the effects of a dozen general anesthetics on the actions of adrenaline and sympathetic stimulation on perfused rabbit ears, isolated frog hearts and the nictitating membrane and blood pressure of spinal cats. In concns. somewhat lower than the estd. anesthetic concns., they all, except chloralose, diminish the effect of adrenaline. The effect of nervous stimulation is diminished, though usually less than that of adrenaline, but once seriously diminished under the influence of stronger solns., its recovery is slower. Chloralose increases the action of adrenaline on the perfused rabbit ear vessels and the nictitating membrane of spinal cats, but diminishes the effect of sympathetic stimulation. Sixty-two references. W. O. E.

Effect of adrenaline on the toxicity of local anesthetics. M. R. Gurd and I. Sachs. *Quart. J. Pharm. Pharmacol.* 12, 713–23(1939).—A study was made of the effect of adrenaline, added in various concns. to solns. of cocaine, on the toxicity of the latter when given subcutaneously to white mice. The lethality curves of cocaine, alone and in combination with various const. doses of adrenaline, show that doses of 0.2 μg./g. (a concn. of 1 in 50,000 of the soln. injected) or more of adrenaline cause a substantial increase in the toxicity of cocaine. Doses of 0.118 μg./g. (a concn. of 1 in 85,000) or less of adrenaline do not have a significant effect on the toxicity of cocaine. Doses of 0.2 μg./g. (a concn. of 1 in 50,000) or more of adrenaline increase the toxicity of procaine in the same way, and roughly to the same extent, as they do that of cocaine. Eleven references. W. O. E.

Pharmacology of the nitrogen group. (Nitrogen, phosphorus, arsenic, antimony and bismuth compounds of the DAB 6.) Hans Braun. *Süddeut. Apoth.-Ztg.* 79, 863–5, 869–71(1939).—71 references. W. O. E.

Pharmacology of the potassium, sodium, lithium and ammonium compounds of the DAB 6. Hans Braun. *Süddeut. Apoth.-Ztg.* 79, 842–5(1939).—39 references. W. O. E.

Effect of ferric chloride on the utilization of calcium and phosphorus in the animal body. Peggy Rehm and Jet C. Winters. *J. Nutrition* 19, 213–22(1940).—When mineral intake was equalized in paired feeding expts. with rats, the addn. of $FeCl_3$ supplements resulted in decreased Ca and P metabolism. When the amt. of cod-liver oil in the diet was reduced by 50%, the addn. of $FeCl_3$ resulted in a less drastic lowering of body Ca and P. C. R. Fellers

Further results on the biological assay of Adonis vernalis glucosides by the guinea-pig method. Fernand Mercier and S. Macary. *Compt. rend. soc. biol.* 132, 529–31(1939); cf. *C. A.* 33, 6956⁹.—The action of the glucosides on the guinea-pig myocardium is quite variable. The guinea pig is not a suitable animal for the assay. L. E. Gilson

Nature of the pilomotor response to acetylcholine; some observations on the pharmacodynamics of the skin. Julius M. Coon and Stephen Rothman. *J. Pharmacol.* 68, 301–11(1940); cf. *C. A.* 34, 519⁷.—Intracutaneous injection of very dil. solns. of acetylcholine and other drugs with a nicotine-like action caused a strong, transient pilomotor activity in the vicinity of the injection. In human skin and in the tail of the cat this response was abolished by sympathetic nerve degeneration, remained active in areas anesthetized by nerve block and could be elicited in extirpated pieces of skin. Local anesthetics, in dilns. as high as 1:200,000, inhibited the reaction. Pitressin and histamine had no inhibitory action. The pilo-erection is apparently effected through an axon reflex involving the terminal ramifications of the post-ganglionic sympathetic fibers supplying the pilomotor muscles. Preliminary observations indicate an accompanying axon reflex involving similarly the terminal branches of the nerves supplying the sweat glands. L. E. Gilson

Thiocyanate formation in cyanide poisoning as affected by methylene blue and sodium nitrite. Ralph G. Smith, B. Mukerji and John H. Seabury. *J. Pharmacol.* 68, 351–64(1940).—The av. normal serum SCN concn. was 111 γ per 100 cc. in dogs and 42 γ in rabbits. The injection of sublethal doses of NaCN resulted in a greater and more rapid increase and a more rapid fall in the serum SCN of the rabbit than of the dog. $NaNO_2$ caused a definite initial depression of the increase in serum SCN after injection of NaCN, in keeping with the hypothesis that part of the cyanide would be held as cyanomethemoglobin and be made unavailable for SCN formation. This effect was more marked in dogs than in rabbits. Methylene blue produced a stimulation of SCN formation in rabbits and a questionable depression of the process in dogs. The excretion of thiocyanates in the urine of the animals was also studied. L. E. Gilson

Respiratory alkalosis during anesthesia. I. Effects on circulatory, respiratory and muscular activity. M. H. Seevers, R. T. Stormont and H. R. Hathaway. *J. Pharmacol.* 68, 365–82(1940); cf. *C. A.* 34, 1077⁸.—Dogs anesthetized with cyclopropane, morphine-ether, morphine-chloretone, barbital, pentobarbital or pentothal were hyperventilated mechanically for 1–15 hrs. Arterial CO_2 decreased 40–87%, the av. of 57 expts. being 66%. The marked arterial hypotension which resulted was due to the combined effects of loss of CO_2 and narcosis, and was proportional to the depth of anesthesia rather than to the loss of CO_2. Fatal circulatory failure and the tetany characteristic of alkalosis did not occur. The duration of

apnea after cessation of forced ventilation was inversely proportional to the duration of hyperventilation and no fatal respiratory paralysis was produced. The relation of these findings to the theory of acapnial "shock" is discussed. II. Influence on survival. M. H. Seevers and R. T. Stormont. *Ibid.* 383–8.—Permanent survival occurred in 17 of 20 barbitalized dogs subjected to excessive mech. hyperventilation sufficient to produce a 40–80% decrease in arterial CO_2 for 1–15 hrs. Two of the others died of lung injuries. Hemoglobinemia and hemoglobinuria were frequent. One dog survived 140 min. of hyperventilation. Fatal respiratory failure after hyperventilation did not occur, the period of apnea ranging from 15 to 200 sec. L. E. Gilson

The effect of quantity on the intensity and duration of local anesthesia, determined by a new test. A. J. Leser. *J. Pharmacol.* 68, 389–94 (1940).—Procaine-HCl in Locke soln. was injected under the conjunctiva of the upper and lower eyelid of the rabbit and the sensitivity of the cornea tested at intervals. The depth of anesthesia depended more on the concn. than on the quantity of drug. The duration was only slightly increased by increasing the concn. L. E. Gilson

A comparative study of twenty-five alkyl thiobenzoates with respect to surface anesthesia, toxicity and systemic effects. H. R. Hulpieu, John H. Kitchel and J. H. Weatherby. *J. Pharmacol.* 68, 395–405 (1940).—Animal expts. were made with 25 compds. of the type $RSC_6H_4COOCH_2CH_2R'$, where R = Me, Et, Pr or Bu in the *o*, *m* or *p* position and R′ = NEt_2, NPr_2, $—CH_2NEt_2$ or $NCH_2(CH_2)_3CH_2$ (piperidyl). All had some surface anesthetic activity but only β-piperidinoethyl *o*-propylthiobenzoate appeared worthy of further study. All produced profound disturbances of the central nervous system and all were irritating. L. E. Gilson

Therapeutic activity of sulfanilamide and allied compounds in experimental brucellosis of mice. John A. Kolmer and Anna M. Rule. *J. Pharmacol.* 68, 406–12 (1940).—In mice infected with *Brucella abortus* aldanil saved 56%, sulfanilamide 37.5%, neoprontosil and sulfapyridine each saved 31% and dagenan 25%. In mice infected with *Br. melitensis* sulfapyridine saved 37.5%, neoprontosil and dagenan 25% each, aldanil 6% and sulfanilamide saved none. None of the compds. saved any mice infected with *Br. suis*. L. E. Gilson

Excretion of a combined form of morphine in tolerant and nontolerant dogs. E. G. Gross and Vincent Thompson. *J. Pharmacol.* 68, 413–18 (1940).—By the use of suitable hydrolysis methods it was shown that dogs excrete morphine in the urine in a free and a combined form. Total recoveries from nontolerant dogs were 80–92% of the amt. administered. Recoveries from habituated dogs were 35–66%, indicating extensive destruction. The nature of the conjugating substance is uncertain but it is apparently not glucuronic acid. L. E. Gilson

Effect of variation of blood pressure on the autonomic nervous system. E. Gellhorn, C. W. Darrow and L. Yesinick. *Proc. Soc. Exptl. Biol. Med.* 43, 236–40 (1940).—Increase in blood pressure induced by adrenaline or injection of Ringer soln. decreases the pupillary diam. and relaxes the nictitating membrane in cats. A fall in pressure induced by amyl nitrite leads to dilation of the normal and sympathectomized pupil. These effects show that a rise in blood pressure produces parasympathetic excitation and sympathetic inhibition and a fall produces the opposite effects. These effects are still produced after bilateral vagotomy and denervation of the carotid sinuses. L. E. Gilson

Destructive effects on carcinoma of colchicine followed by distilled water. M. F. Guyer and P. E. Claus. *Proc. Soc. Exptl. Biol. Med.* 43, 272–4 (1940).—After administration of colchicine to the rats 15 hrs. earlier, Flexner-Jobling carcinomas were frequently rapidly destroyed by distd. water injected directly into the tumor tissue. L. E. Gilson

Comparative clinical values of zinc insulin crystals in solution and unmodified insulin. Garfield G. Duncan, Tracy D. Cuttle and Eric C. O. Jewesbury. *Bull. Ayer Clin. Lab. Penna. Hosp.* 3, 293–306 (1939).—The effects of Zn insulin crystals in soln. and of unmodified insulin in identical doses were observed on 9 diabetic and 9 nondiabetic subjects. The rate and degree of reduction of the blood sugar concn. and its return to the normal or hyperglucemic level were similar in all cases. No evidence of any cumulative effect was noted after use of the respective insulins for 1 week. The effect of com. Zn insulin crystals in soln. was indistinguishable clinically from that of unmodified insulin. Joseph S. Hepburn

Toxicity and rubefacient action of sulfonated higher alcohols. E. H. Hatton, L. S. Fosdick and J. Calandra. *J. Dental Research* 19, 87–92 (1940).—Continued ingestion of large amts. of Na lauryl sulfate (a total of over 100 mg. per kg. of body wt. in daily doses of 30–60 mg.) produced degenerative changes in the liver and intestinal mucosa of rats; these doses were far in excess of the amts. present in tooth pastes and powders. The degree of surface irritation of human mucous membranes produced by 1.25% of this alkyl sulfate (its max. concn. in tooth powder and paste) was less than that produced by castile soap in concns. of 5–16%. Joseph S. Hepburn

Comparative physiological actions of alkyltrimethylammonium and alkali metal salts. Gorden A. Alles and Peter K. Knoefel. *Univ. Calif., Pub. Pharmacol.* 1, 187–211 (1939).—Quant. comparison of muscarine-like and nicotine-like physiol. actions of the *n*-alkyltrimethylammonium salts in the series Me to nonyl showed max. activity in the Bu, Am or hexyl derivs. The same comparison of these actions of the alkali metal salts in the series Li to Cs showed max. activity in K or Rb. Among the lower members of both series of salts, a min. activity might be noted. Both series of salts apparently act only as ions, and the intensity of the physiol. activity is detd. in a limiting way by a dimensional factor. 30 references. Joseph S. Hepburn

Toxicity of certain allylamines. E. Ross Hart. *Univ. Calif., Pub. Pharmacol.* 1, 213–20 (1939).—All but 1 or 2 of 30 albino mice, exposed to the stated concn. (mM per l.) of each of the following compds. in their air supply, died during an exposure period of 10 min.: 1.27 allylamine, 2.1 β-methylallylamine, 0.88 diallylamine, and 0.18 di-(β-methylallyl)amine. The mice which survived exposure to di(β-methylallyl)amine recovered completely; the other mice which survived exposure nevertheless died within 48 hrs. The symptoms in order of appearance were nasoöral irritation, flushing of the ears, irregular respiration, cyanosis, delirium, convulsions, coma and death. When 0.05 cc. allylamine, 0.025 cc. methylallylamine, 0.1 cc. diallylamine, or 0.1 cc. di(β-methylallyl)-amine was applied for 1 hr. to 1 sq. cm. of shaved skin on the abdomen of the albino rat, severe necrosis, sloughing of the skin, and, at times, death resulted. 9 references. Joseph S. Hepburn

Effect of nicotine injections on the secretory functions of the adrenal medulla of the rat. Carroll A. Handley and George F. Warner. *Univ. Calif., Pub. Pharmacol.* 1, 249–69 (1939).—Injection of 1 mg. nicotine into rats rapidly excited the adrenal medulla, increased the liberation of adrenine and had a prompt secondary depressant effect. No further liberation of adrenine occurred on splanchnic nerve stimulation 5 min. after the injection of nicotine. 27 references. Joseph S. Hepburn

Pharmacological comparison between synthetic glycerol and glycerol prepared from natural oils. E. Ross Hart. *Univ. Calif., Pub. Pharmacol.* 1, 271–4 (1939).—Natural glycerol and synthetic glycerol, manufd. from propylene, did not exhibit any significant differences in toxicity expts. on oral administration, on striated muscle or as a local irritant. Doses as large as 25 g. of undild. glycerol per kg. of body wt. were administered to rats by means of a stomach tube without ill effects. Direct application of 0.1–1.0 cc. of undild. glycerol to the conjunctival sac of rabbits produced only a very transient irritation, owing to the dehydrating action of the glycerol and it was rapidly counteracted by the secretion of tears. Glycerol de-

creased the rate of relaxation of the frog gastrocnemius after faradic stimulation. Joseph S. Hepburn

Carbon monoxide poisoning of chicks and poults in poorly ventilated brooders. Geo. W. Stiles. *Poultry Sci.* **19**, 111–15(1940).—Several hundred dead chicks and poults from poorly ventilated brooders in the Denver area gave pos. blood tests for CO poisoning. Tests of air in poorly ventilated, overcrowded brooder houses usually showed CO. Exptl. gassing of 30 3-week-old chicks in an atm. of approx. 0.4% CO, with CO_2 removed, showed varying tolerances to CO. In a similar lot exposed to 0.8% CO, without removal of CO_2, only 8 survived after 60 min. CO poisoning seems to cause as many deaths in poultry houses as does pullorum disease. K. D. J.

Chemical agents in the prevention and treatment of experimental poliomyelitis. E. W. Schultz. *Am. J. Pub. Health* **30**, 175–9(1940).—A review. J. A. K.

Effect of testosterone on serum lipides in schizophrenia. Lowell O. Randall. *J. Biol. Chem.* **133**, 137–40(1940); cf. *C. A.* **33**, 7901[8].—The injection of testosterone propionate during a period of 3 weeks into 9 schizophrenic subjects produced a continuous rise in serum lipides followed by a return toward the initial level after medication. Sesame oil injections had no significant effect in 10 subjects. It is possible that the male sex hormone affects the low lipide metabolism of schizophrenic individuals by an indirect action on other glands of internal secretion. A. P. Lothrop

The excretion of volatile selenium compounds after the administration of sodium selenite to white rats. Julius Schultz and Howard B. Lewis. *J. Biol. Chem.* **133**, 199–207(1940); cf. *C. A.* **34**, 815[8].—After subcutaneous injection of 2.5–3.5 mg. of Se per kg. of body wt. as Na selenite into white rats, 17 to 52% of the injected Se was excreted as a volatile compd. which was absorbed by concd. H_2SO_4. This excretion was not increased by administration of either methionine or choline chloride, sources of Me groups which might assure ready methylation. Thus far Hofmeister's hypothesis (*Arch. exptl. Path. Pharmakol.* **33**, 198(1893–4)) that the volatile Se compd. excreted is di-Me selenide lacks adequate exptl. proof. A. P. Lothrop

The concentration of sulfanilamide in the saliva following oral administration. Stanley Williams, Beryl Splatt and Rachel Jakobowicz. *Med. J. Australia* **27**, 120–4(1940).—In single doses, sulfanilamide, approx. 50 mg. per kg., failed to produce any excretion of the drug in the saliva, but after repeated doses of 70 mg. or more per kg. a few mg. of the drug was present in the saliva. The amts. excreted in the saliva were in no way affected by the concn. found in the blood. G. H. W. L.

Rash following the use of sulfanilamide. J. E. Barker. *Med. J. Australia* **27**, 124–5(1940).—A report of painful skin lesions following the administration of sulfanilamide. G. H. W. Lucas

Naphthalene poisoning. N. R. Konar, H. K. Roy and M. N. De. *Indian Med. Gaz.* **74**, 723–5(1939).—A patient suffering from acute naphthalene poisoning showed coma with hemiplegia, severe jaundice, rapidly developing anemia, hyperthermia and, post-mortem, patchy hepatic necrosis. The fever may have resulted from cholemia or possibly formation of naphthylamine. J. McAfee

The influence of liver extract on the oxygen consumption of mammalian erythrocytes. III. The mechanism of the reaction. Ascorbic acid systems. G. A. Overbeek. *Rec. trav. chim.* **59**, 14–20(1940); cf. *C. A.* **34**, 1745[1,8].—The possibility that the system of Michaelis and Salomon is identical with that of v. Szent Gyorgyi (cf. *C. A.* **32**, 1732[7]) is made remote by the facts that ascorbic acid and glutathione, alone or together or added to liver ext., or ascorbic acid with irradiated liver ext., do not augment respiration. The possibility that blood destruction due to liver ext. consumes O (cf. Fischer and Lindner, *C. A.* **20**, 3016; Karrer, v. Euler and Hellström, *C. A.* **27**, 2180; Lemberg, *Perspectives in Biochem.* 1938, p. 137) is excluded by the facts that activity in changing spectroscopic bands from hemochromogen to verdohemochromogen resides chiefly in liver pulp, the action of which is augmented by less active spleen pulp and ext., and that respiration is not augmented by spleen pulp. **IV. The mechanism of the reaction. Yellow enzymes.** *Ibid.* 21–6.—That the "original" yellow enzyme of Warburg participates in the reaction is rendered likely by the known presence of yellow enzyme in liver, the inactivation of liver ext. by ultraviolet light and partial insensitivity to poisoning by cyanide. Lactoflavin without carrier combined with rabbit erythrocytes does not augment respiration, so the complete substance, if responsible, is necessary. Exts. of livers from adrenalectomized rats are not less effective (cf. Verzár, Hübner and Laszt, *C. A.* **31**, 7971[3]), rendering the participation of yellow enzyme in a large part of the reaction unlikely. Amino acid oxidase is excluded by nonproduction of ammonia or urea. Xanthine oxidase is probably not responsible, although *p*-aminophenol partially inhibits respiration (cf. Bernheim, Bernheim and Michel, *C. A.* **32**, 1332[1]) since uric acid could not be detected (by the method of Flatow, cf. *C. A.* **21**, 932 and of Dekker (*Handleiding voor het klinisch chemisch onderzoek*, J. W. Groen, Leiden 1939, p. 161)) even when respiration increased after adding hypoxanthine. J. McAfee

The development of fibrosarcoma as a result of the intra-articular injection of radium chloride for therapeutic purposes. A new form of radium poisoning in human beings. Flemming Mørgaard. *Am. J. Cancer* **37**, 329–42(1939).—Tibial fibrosarcoma, hyperplasia of the bone marrow and radiation osteitis, indicating Ra poisoning, were found in a patient who, 9 yrs. previously, had received an injection of 10 γ $RaCl_2$ into the knee joint as treatment for arthritis. Radioactivity of the patient was detected by the Geiger counter. E. R. Main

Intravenous use of mandelic acid for urinary antisepsis. I. An experimental study of excretion and toxicity. S. McMahon. *J. Urol.* **41**, 611–21(1939).—Intravenous injections of 2.5–20% solns. of Na mandelate of pH 7.2–7.4 are well tolerated by dogs, providing the total dose is less than 20 g. After injection of a 20% soln., the concn. of the salt in the urine remains high for about 4 hrs. The pH of the urine is not affected. Large doses may cause impairment of kidney function and changes in the tissues of the kidney and liver, but these effects do not persist. Other salts of mandelic acid are unsuitable for intravenous injection. E. R. Main

Acetylsulfanilamide. Its absorption, excretion and toxicity in man. Nelse F. Ockerblad and Hjalmar E. Carlson. *J. Urol.* **41**, 801–7(1939).—Dogs which received acetylsulfanilamide (I), in a dose of 4 g. per kg., showed toxic symptoms after 8–12 hrs. The symptoms lasted 8–10 hrs. and were accompanied by a reduction in the CO_2-combining power of the blood. The max. concns. of I in the blood ranged from 28.6 to 32.3 mg. % and free sulfanilamide was found in concns. as high as 6.3 mg. %. From 52.7 to 91.8% of the amt. of I given was recovered in the urine and feces. The rate of absorption and excretion of I by man was slow. No toxic reactions were observed when I was given in doses of 1.94 g. 4 times a day for periods of 3 to 14 days. The CO_2-combining power of the blood was reduced but no significant changes were observed in nonprotein N, urea, creatinine, sugar and chloride contents. The max. concn. of I in the blood was 6.2 mg. %, that of free sulfanilamide 1.0 mg. %. The drug showed a slight degree of therapeutic effectiveness against gonococcic urethritis and no demonstrable effect in chronic prostatitis. E. R. Main

M. and B. 693 (sulfapyridine) in the saliva. B. W. Fickling, Paul Pincus and Brian Boyd-Cooper. *Lancet* **1939, II**, 1310–11.—The concn. of sulfapyridine in the saliva of patients receiving 3 g. daily ranged from 3 to 6 mg. %. E. R. Main

Report on medical progress: pharmacology. G. Philip Grabfield. *New Engl. J. Med.* 221, 464–8(1939).—A review of the literature of 1939 with 34 references. E. R. Main

The reciprocal pharmacologic effects of amphetamine (benzedrine) sulfate and the barbiturates. Abraham Meyerson. *New Engl. J. Med.* **221**, 561–4(1939).—The

undesirable effects arising from the use of large doses of barbiturates in treatment of epilepsy, depressions and other disturbances can be in part or wholly counteracted by small doses of amphetamine sulfate (I). Similarly, the effects of large doses of I can be mitigated by small doses of barbiturates. E. R. Main

The effect of amphetamine (benzedrine) sulfate and paredrine hydrobromide on sodium amytal narcosis. Abraham Myerson, Julius Loman, Max Rinkel and Mark F. Lesses. *New Engl. J. Med.* 221, 1015–19(1939).—The narcosis produced by intravenous administration of Na amytal is prevented or counteracted by amphetamine sulfate but is unaffected by paredrine (*p*-hydroxy-α-methylphenylethylamine). E. R. Main

The effect of cinchonine on salivary secretion. Luigi Liaci. *Biochim. terap. sper.* 26, 429–36(1939).—Cinchonine causes a decrease in salivation but does not lead to complete inhibition. Pilocarpine completely overcomes the effect of cinchonine, but large doses of the latter do not decrease the flow of saliva caused by the former. Both alkaloids exert their action on the same nervous pathways. A. E. Meyer

Treatment of pain after amputations with synthetic vitamin B_1. A. Sliosberg. *Presse méd.* 47, 1589–91 (1939).—Injections of vitamin B_1 caused prompt subsidence of pain. The improvement was lasting. The action is not on the stump itself but by way of the nervous system. A. E. Meyer

Preliminary report on the presence of an estrogenic substance and a poisonous substance in the storage root of Butea superba Roxb. Sup Vatna. *Thai Sci. Bull.* (Bangkok) No. 4, 3–9(1939).—The storage root of *Butea superba* Roxb. (a climbing legume growing wild in Thailand, Burma and India) contains both an estrogenic substance and a poison. The poisonous substance dissolves readily in water but sparingly in 95% alc. An aq. ext. equiv. to 0.06 g. of the dried powder of the *Butea* root produces symptoms of poisoning in adult mice, while doses greater than this are fatal. Very large doses of an alc. ext., evapd. to dryness and suspended in olive oil, produce only mild symptoms of poisoning. However, an injection of this ext. equiv. to 0.002 g. of the dried powder is the min. dose which will cause estrus in spayed female mice. The aq. ext. from 0.015 g. of the powder is the min. amt. which will cause estrus, and at this diln., the poison dissolved produces no visible effect on the mice. Dorothy A. Meyer

The mechanism of the action of a series of medicinal agents on the biliary tract. Yu. A. Petrovskiĭ. *J. Physiol.* (U. S. S. R.) 21, 293-310(1936); *Chem. Zentr.* 1938, I, 4205.—The investigations (on dogs) were carried out by the method of the isolated Oddi sphincter and fistula of the entire biliary tract. The action of concd. solns. of $MgSO_4$ *in situ* as well as on the isolated organs produced a weakening of the tone of the distal portion of the entire biliary tract which can be of importance as regards the mechanism of the bile flow. *Papaine* had a similar effect. Large doses of *pilocarpine* strengthened the tone of the distal portion of the entire biliary tract and of the gall-bladder system. The opposite effect was observed with *atropine*. The mobility of the smooth musculature of the bile tract was not paralyzed by atropine but only weakened, while the periodic increase in tone was maintained. *Adrenaline* produced a periodic weakening of the tone of the gall-bladder system with an equally great periodic strengthening of the tone of the distal portion of the general biliary tract. The reverse effect was observed with *gynergen*. Under the influence of *peptone* a more or less pronounced shortening of the musculature of the gall-bladder system appeared. The action of peptone was less pronounced on the distal portion of the whole biliary tract. Under the influence of *pituitary prepns.* (Pituglandol "Roche") a more or less definite strengthening of the tone of the musculature of the gall-bladder system could be detected. In one series of expts. a weakening of the tone of the distal portion of the whole gall-bladder system was also observed. Under the influence of *egg yolk* a weakening of the tone of the distal portion of the entire biliary tract occurred together with a strengthening of the tone of the gall bladder. Dil. *salt solns.* weakened the tone of the Oddisphincter; *alkalies* strengthened it. Under the influence of *morphine* an increase in the tone of the gall-bladder system as well as that of the distal portion of the general biliary tract could be detected. With a series of prepns. (egg yolk, histamine, adrenaline, gynergen) an "interplay" of the distal portion of the general biliary tract and of the gall-bladder system was observed. This interplay was disturbed by the action of vagotropic substances such as morphine and papaverine. Substances which affect the bile flow can be divided into 2 groups: the "cholespasmolytica" which primarily weaken the tone of the distal portion of the general biliary tract, and the "cholekinetica" which increase the tone of the smooth musculature of the gall-bladder system. Use of the substances of the first group is indicated in spastic conditions of the bile tract (spastic forms of dyskinesia) while the substances of the 2nd group are indicated in atonic conditions (atonic forms of dyskinesia). M. G. Moore

The action of iodine salts on the supply of vitamin C in the organism. G. A. Uzbekov. *Klin. Med.* (U. S. S. R.) 15, 1092-5(1937); *Chem. Zentr.* 1938, I, 4351.—After the administration of 2 doses of 0.5 g. KI daily to rabbits for 30 days there were observed reductions in the ascorbic acid contents of the suprarenal capsule of 67%, testicle 57%, spleen 43.5% and cerebrospinal fluid 50%. In the blood the concn. of dehydroascorbic acid increased by 25%. The possibility of the development of a hypovitaminosis during treatment of syphilis, Basedow's disease and arteriosclerosis with I therapy is suggested. M. G. Moore

The new anesthetic convocaine. V. A. Avrutova. *Sovet. Rachelny Zhur.* 41, 837–42(1937); *Chem. Zentr.* 1938, I, 4496.—Three derivs. of convolvine and convolamine (prepd. from *Convolvulus pseudocanthabricus*) are designated convocaine. They are readily sol. in water and resistant to boiling. The best effect is obtained with convocaine I, which in 1–2% soln. produces excellent surface and deep anesthesia of the eyeball for 35 min. There is no irritation of the epithelium of the cornea nor any effect on accommodation. In contrast to cocaine, convocaine I possesses the advantage that it does not alter the intraocular pressure. The toxicity of the prepn., as measured with white mice, is about double that of cocaine. The prepn. has been tested by use for various eye operations. Convocaine II and III show a weaker anesthetic action and a slight irritating effect on the epithelium. M. G. Moore

Lipoid-sarcoid reaction induced by foreign body (silica). Wm. M. German. *Am. J. Clin. Path.* 10, 245–50(1940). —A case is reported which shows a subcutaneous tissue tuberculoid reaction in which the etiological reagent is presumably silica. Every effort was made to rule out a coexistent tuberculosis. 12 references. J. T. Myers

The influence of intravenous glucose injections on abnormal erythrocyte sedimentation speed in relation to activity of infection. S. S. Lichtman. *Ann. Internal Med.* 13, 1297–1305(1940).—Daily intravenous glucose injections administered to 19 subjects with various types of disease and infection, including rheumatic fever and pulmonary tuberculosis marked by abnormal erythrocyte sedimentation speed, slowed the rate in 7 cases. No slowing was noted in the presence of fever or leucocytosis. 26 references. John T. Myers

Arsphenamine poisoning with report of four cases. Gerald C. Parker and Orman C. Perkins. *Ann. Internal Med.* 13, 1307–16(1940).—The administration probably causes an agglutination of the erythrocytes resulting in minute emboli which lodge in the brain and other special organs and cause rupture of the weakened vessel. John T. Myers

A method for determining the effect of chemical antisepsis on phagocytosis. Henry Welch. *J. Bact.* 39, 337–8(1940). John T. Myers

Hematopoietic affections in experimental poisoning by barium salts. G. G. Zolezzi and A. Stazzi. *Med. lavoro* 30, 9–20, 44–55(1939); *Chimie & industrie* 42,

271.—The rabbit was used as exptl. animal. Lethal doses of $BaCl_2$ and of $Ba(NO_3)_2$ cause a notable increase in red and particularly in white corpuscles, especially at the expense of polymorphonuclear forms; the increase seems to be temporary. There is probably an initial vasoconstriction followed by hemolysis. In small doses Ba salts stimulate the blood-forming organs: the bone marrow is stimulated, while toxic doses cause degeneration of the various tissues in the marrow. Under the action of Ba salts the liver becomes congested and diffuse vascular degeneration ensues. There is an increase in the no. of Kupffer's cells and of eosinophilic polynuclear elements in the liver. In acute and subacute intoxications the spleen undergoes the following changes: hyperplasia of the gray pulp and of the red pulp and finally sclerofibrosis of the gland. A. Papineau-Couture

The effect of urea and narcotics on the action of acetylcholine on the frog heart. Fritz Heim. *Arch. exptl. Path. Pharmakol.* 192, 1–17(1939).—Urea annuls, reverses or increases the action of acetylcholine on the frog ventricle, depending on its ability to increase or decrease the swelling and permeability of ventricular tissue. Narcotics (chloral hydrate, urethan, $CHCl_3$) which decrease such swelling and permeability enhance acetylcholine action. J. Pinchack

Intestinal effects of intravenously administered saline purgatives. Zengo Kanda. *Arch. exptl. Path. Pharmakol.* 192, 64–9(1939).—Given intravenously, Na_2SO_4, $Na_2S_2O_3$, $MgCl_2$, $MgSO_4$ and K_2SO_4 are completely inactive on intestinal peristalsis in guinea pigs. $MgSO_4$ and K_2SO_4, however, have a paralyzing effect which can be annulled by $CaCl_2$. J. Pinchack

Elimination of parenterally administered metrazole from the organism. K. Hinsberg. *Arch. exptl. Path. Pharmakol.* 192, 90–5(1939); cf. Esser and Kühn, *C. A.* 27, 5815.—An improved method of extg. metrazole from organs is based on pptg. the $CHCl_3$-extd. material with phosphotungstic acid in the presence of 2.5% HCl. The difficultly sol. product of const. wt. obtained is decompd. and the metrazole in the filtrate pptd. by sublimate and its m. p. detd.; exptl. error was about 2%. With this method no more than 5.2% of the injected metrazole could be recovered from the organs of guinea pigs. The drug was found in the intestine and feces, but was too firmly combined in the latter to be detectable. J. Pinchack

Pharmacological action on the vegetative centers. II. Hans T. A. Haas. *Arch. exptl. Path. Pharmakol.* 192, 117–30(1939); cf. *C. A.* 33, 8787[3].—The influence of pilocarpine (I), adrenaline (II) and ergotamine (III) on the vegetative centers was demonstrated by their ability to decrease the acetylcholine (IV) content of the brain stem and cortex of eserinized leeches. This decrease was apparent with large doses of I and II and small doses of III given intracisternally; IV, itself, was inactive. Neither I nor III was active intravenously, as was II. Paraldehyde, but not III, antagonized the effect of II. III. *Ibid.* 350–60.—The study was continued with intracisternal or intravenous injections of I, II, IV and picrotoxin (V), and intravenous injections of III or ergometrine (VI) in rabbits previously subcutaneously injected with paraldehyde (VII) or intravenously with atropine. The direct central action of I, II and V and the highly improbable one of III, IV and VI were indicated by the fact that VII reduced the fall in temp. and rise in blood sugar after I and V, but not after III, IV and VI, and that it counteracted the effect of II on blood sugar and leucocytes. J. P.

Investigations of the cumulation of digitalis substances. Werner Lindner. *Arch. exptl. Path. Pharmakol.* 192, 155–68(1939).—Functional and necrotic cardiac changes were produced in cats with digitoxin and oleandrin given in large single doses up to a total of 55% of the Hatcher dose, or in small single doses given for a prolonged period (3.3 or 5% of Hatcher dose daily for as long as 44 days). J. Pinchack

The cumulation of genins of cardioactive glucosides. Werner Lindner. *Arch. exptl. Path. Pharmakol.* 192, 169–78(1939).—Digitoxigenin (I), k-strophanthidin (II), ditoxigenin (III), oleandrigenin (monodiacetylgitoxigenin, IV) and oleandrin (V) were administered for 6 days to cats which then received an infusion of g-strophanthin. Definite cumulative symptoms appeared with 15% of the m. l. d.'s of I and II, but although 15–25% of the m. l. d. of III and 7–15% of the m. l. d. of IV produced toxic reactions, there was no cumulation. III and IV then have a different mode of action from that of the other digitalis glucosides. The cumulative dose of V was 3–5% of its m. l. d. J. Pinchack

Change in acetylcholine action through adsorption of proteins. Fritz Heim. *Arch. exptl. Path. Pharmakol.* 192, 276–91(1939).—Acetylcholine action on ventricular contractility in the frog is retarded and prolonged when serum albumin or pure serum is added to the perfusing Ringer soln. The change is due to adsorption of the acetylcholine on the protein. J. Pinchack

Changes in the hydrogen-ion concentration of the blood in experimental circulatory shock [produced by histamine, peptone or procaine]. E. Lerche. *Arch. exptl. Path. Pharmakol.* 192, 309–20(1939). J. Pinchack

Carbon monoxide poisoning and gastric juice secretion. G. Walther. *Arch. exptl. Path. Pharmakol.* 192, 361–71 (1939).—Neither acute nor chronic CO poisoning changes the gastric-juice curve appreciably; anacidity is never found. A restricted gastritis is evident after 3–4 months of CO-allyl formate poisoning, attributable to the formate; anacidity is still absent. J. Pinchack

Blood-pressure experiments with adrenaline and acetylcholine. W. Riechert and E. Schipkus. *Arch. exptl. Path. Pharmakol.* 192, 372–82(1939).—The hypertensive action of adrenaline (I) is shortened by acetylcholine (II), whose efficacy depends upon how soon it is given after I. Gynergen prolongs the effect of II through its sympatholytic action. J. Pinchack

The anti-inflammatory action of pure azulene from Matricaria chamomilla L. Wolfgang Heubner and Wolfgang Albath. *Arch. exptl. Path. Pharmakol.* 192, 383–8 (1939); cf. *C. A.* 33, 1441[4].—Tests in rats, rabbits, cats and man show that the anti-inflammatory principle of the essential oil of *Matricaria chamomilla* L. is azulene. It was pptd. from the oil by ferrocyanic acid and purified by chromatography. J. Pinchack

Strophanthin action and cholinergic mechanism of the heart. J. Kull. *Arch. exptl. Path. Pharmakol.* 192, 447–56(1939); cf. *C. A.* 33, 6961[1]. J. Pinchack

Action mechanism of organic nitro compounds. Ed. Keeser. *Arch. exptl. Path. Pharmakol.* 192, 618–24 (1939).—Nitro compds. act primarily on the sympathetic nervous system, but also influence basal metabolism, decreasing reduction processes in muscles and sometimes catalase activity. The latter effect of nitrobenzene and nitrophenol is inhibited *in vitro* by sympathol (I), pilocarpine (II), acetylcholine (III) and glutathione (IV). In guinea pigs, thiourea, thiodiglycol, $FeSO_4$, cholic acid, lecithin-cholesterol (V), Hepatrat, I, II and III have no effect on $EtONO_2$ poisoning. $MnSO_4$ and KI retard the appearance of symptoms, cysteine enhances toxicity, while IV, ergotamine tartrate (VI), thionine and hemin are increasingly antagonistic in that order. Ascorbic acid is inactive against $EtONO_2$ poisoning, but annuls the effects of toxic doses of dinitroglycol in guinea pigs and dogs. In contrast, IV, V, VI, hemin and Ca lactate enhance dinitroglycol toxicity. J. Pinchack

The effect of circulatory-active drugs on veins. R. Domonjoz and A. Fleisch. *Arch. exptl. Path. Pharmakol.* 192, 645–63(1939).—A similar relation exists between chem. constitution and vasoconstrictor action of sympathomimetic substances as between constitution and sympathomimetic action. The drugs tested included veritol, adrianol, sympathol, 2 - (3′,4′,5′ - trimethoxybenzyl)imidazoline (Ciba 2020), ephedrine, pseudoephedrine, *m* - hydroxyephedrine, suprifen, benzedrine, pervitin, *N* - dimethyl - 1 - phenylisopropylamine, *N*-methyl - 2 - phenylpropylamine, tyramine, *m*- and *p*-hydroxynorephedrine, 1 - (*m* - hydroxyphenyl) - 2-methylaminobutanol, 1 - (3′,4′ - dihydroxyphenyl) - 2-propylaminopropanol and corbasil and their optical

isomers. The weakest drugs are those without a phenolic OH group. Oxidation of the benzene ring in para position slightly increases vasoconstriction, in meta position greatly increases it. The dihydroxybenzene derivs. are somewhat less active than the *m*-phenol derivs., probably because of lesser stability. Substitution on the NH_2 group decreases vasoconstriction, double substitution being no more detrimental. The 2-membered side chain is the most active. Lengthening the side chain decreases activity. J. Pinchack

Toxicology of *p* - sulfanilamidoacetophenone. H. Möller. *Arch. exptl. Path. Pharmakol.* 192, 708–14 (1939).—*p*-Sulfanilamidoacetophenone forms a slightly yellowish white cryst. powder which m. after sintering at 207–9°. It is very slightly sol. in water, but is more sol. in dil. alkalies and in NH_3, as well as in hot MeOH and acetone. The mol. wt. is 290. The compd. is very similar to sulfanilamide in its antistreptococcal action but is much less toxic in mice, rats and cats. The rate of urinary excretion of the 2 compds. in the dog is about the same. J. Pinchack

Nativinsulin. Siegfried Irle. *Med. Klin.* 35, 1316–17 (1939).—Insulin treated with $MgCl_2$ (nativinsulin) shows the prolonged (24 hrs.) antiglycosuric action of protamine Zn insulin, without the attending hypoglycemic reactions. J. Pinchack

Experimental poisoning with heavy metals; function of the thyroid and porphyria. Istvan Sümegi and Gyula Putnoky. *Arch. Gewerbepath. Gewerbehyg.* 9, 566–91 (1939).—Rats were subjected to minute doses of Pb, Bi, Hg, Au, Ag, Cu, Zn and Fe. With Bi, there was a min. damage to the liver and kidneys; with Au, the kidneys functioned normally while the liver showed slight damage. Zn caused slight functional changes in the kidney. All these metals produced hepatorenal disturbance with simultaneous hyperfunction of the thyroid and porphyrinuria, the latter due to injury of the bone marrow. Later, these metals stimulated the autonomic nerve centers in the midbrain and pituitary gland, resulting in thyrotoxicosis of central origin. Maurice M. Rath

The toxicity of carbon monoxide at high altitudes. J. W. Heim. *J. Aviation Med.* 10, 211–15 (1939).—The literature lacks information on the tolerance to CO at high altitudes, on the accurate detn. of the behavior of this gas at reduced atm. pressures, and on permissible concns. in aircraft compartments operating at great heights. Based on O-CO distribution laws in the blood and available data of partial pressures of O in the alveolar air at various altitudes, H. has derived equations to det. the effect of various concns. of CO. It was calcd. that a concn. of 0.01% CO in the air at 10,000 ft. reduces the O-carrying capacity of the hemoglobin by 10.5%, which is enough to produce some anoxemia. Curves were constructed showing the variation in arterial O tension at different altitudes for different CO concns. Concns. of CO which are innocuous at sea level become dangerous at even moderate altitudes, and it is imperative that not a trace of this gas should be permitted to exist in airplane compartments. Maurice M. Rath

Prontosil in the treatment of cholangitis and its experimental foundation. R. Mancke, K. Plötner and W. Siede. *Münch. med. Wochschr.* 86, 1550–5 (1939).—Expts. on dogs with biliary fistulas were conducted to study the elimination of prontosil. The content in the bile was studied by chromatographic adsorption analysis. 1 cc. of bile is placed in an adsorption tube 15 cm. long and 0.8 cm. in diam. which is filled with Al_2O_3 and washed with distd. H_2O. The bilirubin and biliverdin are adsorbed completely in the upper part of the tube. Prontosil, however, migrates to the bottom as a red ring and can be washed out with distd. H_2O. H_2O is added up to 25 cc. and the amt. detd. in a wedge photometer. Clinical observations were made on patients with biliary disorders. Maurice M. Rath

A new chemotherapeutic agent for the treatment of brucellosis in man. Hans Scholer. *Schweiz. med. Wochschr.* 69, 685–6 (1939).—Treatment of a case of undulant fever with sulfapyridine (total dosage of 17.5 g. in 8½ days) resulted in rapid therapeutic effects. No other medication was given except for a small amt. of vitamin C. Eight hrs. after the first dose, the temp. fell. On the twelfth day, the patient was afebrile, had gained weight and had resumed full work with no recurrence of symptoms. At the start of treatment the agglutination titer of *Brucella abortus* was 1:3200; 23 days later, it was 1:400. Maurice M. Rath

The excretion of stilbene preparations. P. Caffier and E. S. Oeskayaalp. *Zentr. Gynäkol.* 63, 1218–31 (1939).—Rapid excretion of stilbene prepns. resulted when injected into rabbits, with castrated mice as recipients for untreated urine. The responses were graded into 10 stages, from castrate to full estrous response. The smallest recognizable reaction was produced by 0.005 γ. The acetate or propionate esters had a prolonged activity. Excretion was detected within 5 hrs. in the human subject, and after a single dose of 2.5 or 5 mg. excretion continued for 10 to 16 days. Max. excretion seemed over by the 5th day, suggesting this as the time for repeated injection if sustained effects are desired. From the 5th to 11th days after 5 mg. was injected, about 7.5% of the dose was recovered in the urine. Maurice M. Rath

Selenium and duck sickness. Arthur C. Twomey, Sarah J. Twomey and Loring R. Williams. *Science* 90, 572–3 (1939).—Livers of ducks and shore birds found dying of duck sickness in seleniferous regions show definite traces of Se. There is also a marked decrease in the size and wt. of the livers. Ducks fed Se in concns. up to 18 p. p. m. show the same symptoms. Higher concns. of Se kill the birds in 10–24 hrs. without symptoms of liver shrinkage. Felix Saunders

The pharmacology of soaps. The irritant action of refined oil soaps on human skin. Byron E. Emery and Leroy D. Edwards. *Oil & Soap* 17, 64–6 (1940).—Neutral Na and K soaps of 19 oils were prepd. and 5% solns. were applied to the skin of males and females. It was found, as would be expected, that soaps from oils contg. lauric and myristic acids such as coconut, palm, palm kernel, cottonseed and avocado caused irritation. These oils produced irritant soaps in an approx. order of their lauric and myristic acid content. Castor oil soaps are the most irritant of all the soaps studied. This oil does not contain any of the irritant soap acids and its action is unexplainable. In general the K soaps are more irritant than the Na soaps. Females are more subject to soap irritation than males. E. Scherubel

Experimental investigation on the absorption of mercury vapors. Folco Domenici. *Rass. med. ind.* 10, 703–11 (1939).—Expts. were conducted on rabbits in a special box maintained at temps. below those of the animals, which could be exposed to the fumes of Hg in such a way that they either inhaled them through the respiratory system or took them into the digestive tract. When the fumes were taken into the respiratory tract intestinal lesions appeared in only a small percentage of the animals, and the nervous system was affected as well as the nasal passages. When the fumes entered the digestive system the typical intestinal hemorrhagic lesions were present. In this way may be explained the nervous disorders occurring in cases of Hg poisoning. Marcelle Schubert

The effect of administration of an acetate on detoxication and therapeutic activity of sulfanilamide. G. V. James. *Biochem. J.* 33, 1688–93 (1939).—Mice receiving AcONa along with sulfanilamide (I) excreted more acetylsulfanilamide (II) than mice which received the same dose of I alone. Such combined treatment did not diminish the curative value of I but was effective in modifying the acute toxic symptoms resulting from a large dose of I. When smaller doses were given over a longer period, acetate did not affect the result. E. W. Scott

In vitro action of insulin on minced avian and mammalian muscle. Ephraim Shorr and S. B. Barker. *Biochem. J.* 33, 1798–1809 (1939).—The insulin effect described by Krebs and Eggleston (*C. A.* 32, 7134[3]), consisting of the better maintenance of O consumption in minced pigeon-breast muscle, was confirmed. No com-

parable effect could be observed on the respiration of minced chicken-breast muscle, minced skeletal muscle of the cat, dog and rabbit, or minced dog cardiac muscle. Therefore, it is doubtful if the insulin effect in pigeon-breast muscle exemplifies the general mechanism of insulin action on carbohydrate oxidation. The result of disruption of the intercellular organization of muscle by mincing is to stimulate the oxidation of carbohydrate, even in the absence of insulin. E. W. Scott

The fate of strontium after intravenous administration to normal persons. Robert A. McCance and Elsie M. Widdowson. *Biochem. J.* **33**, 1822–5(1939).—Daily doses of 47 mg. of Sr were injected intravenously into 2 normal subjects for 5 days. The Sr was excreted slowly, 90% of it by the kidney. E. W. Scott

Permeability of the lymphatic vessels of the skin. I. The effect of various stimulants. Heigaku Choh. *J. Chosen Med. Assoc.* **29**, 2469–88(1939).—The permeability (A) of lymphatic vessels of the ear of the rabbit is increased by mech. and chem. stimuli. Oral administration of 0.5–2.5% NaCl, 2.5% $NaHCO_3$, 5% sucrose, 10% glucose and 5% $CaCl_2$ solns. increases A, and this is due to water intake, since distd. H_2O per se produces the same effect. Subcutaneous injection of adrenaline or pilocarpine inhibits A, but injection of atropine increases it. Narcosis with Et_2O and $CHCl_3$ increases A, so does cervical sympathectomy, section of the auricular nerve or direct stimulation of the ear by faradic current. A was measured by the time required for Trypan Blue to begin to diffuse out of the lymphatic vessels. **II. Its role in edema formation.** *Ibid.* **30**, 39–55(English abstr. for I and II, 4–5)(1940).—In edema due to starvation, or exptl. nephritis caused by cantharidin or $K_2Cr_2O_7$, both A and turgidity of the cutaneous tissues, increase. In edema due to local stasis, thyroidectomy, or reticulo-endothelial blockade, A rises together with the water content of the tissue, but does not always change in parallel with the turgidity of the tissue. S. Tashiro

Experimental and clinical studies on the influence of chronic poisoning with opium and allied drugs on the female genital organs. VI. Genital organs of rabbits and mice chronically poisoned with opium, and endocrine organs of a mouse fetus of a mother chronically poisoned with opium. T. R. Ko. *J. Oriental Med.* **31**, 1333–49 (German abstr. 117)(1939); cf. *C. A.* **34**, 526[4]. S. T.

Effect of continuous feeding of inorganic iron. IV. The content of deposit iron by the feeding of ferrous carbonate. Nobumasa Hayasi. *J. Oriental Med.* **31**, 1351–76(English abstr. 118)(1939); cf. *C. A.* **34**, 172[7,8].—Iron contents of various tissues were analyzed after feeding with 0.6 g. $FeCO_3$ daily for 2–35 days, either at the end of feeding or at 3–34 days after the end of the last feeding. The results are given in 10 tables and 38 charts. In general the data show there are remarkable increases of deposit iron in spleen, liver, bone marrow, appendix, colon, lung and kidney, the increase being noted soon after the feeding started; it reaches a certain height and remains there regardless of further feeding. The content of deposit iron in the tissues does not return to normal even at the end of 34 days after the discontinuance of the iron feeding. S. Tashiro

The responses of the nictitating membrane of the cat to certain stimulants after ergotoxine. G. H. Acheson. *Am. J. Physiol.* **128**, 695–702(1940).—The nictitating membrane of the ergotoxinized cat responds to adrenaline or noradrenaline with a relaxation, but to nerve impulses or acetylcholine with a contraction followed by a relaxation. Dale's theory of the mode of action of ergotoxine reversal is held to be inapplicable to certain organs. An alternative theory is tentatively adopted. The explanation proposed by Dale and Gaddum (*C. A.* **25**, 3046) is adopted to account for the difference in response between nervous stimulation and adrenaline. E. D. Walter

The effect of dinitro-*o*-cresol on fish. W. Speyer. *Nachbl. deut. Pflanzenschutzdienst* **19**, 43(1939).—Dinitro-*o*-cresol caused the death in all cases of *Gasterosteus aculeatus* L. in 3 hrs. at concns. as low as 0.0005%. V. L. F.

Local anesthetics of 4-quinolinecarboxylic acid series (Lur'e) 10. Constitution of conjugated phenolphthalein formed in animal body (Di Somma) 11A. Thiocyano derivs. of hydnocarpic and chaulmoogric acids [effect on leprosy in mice] (Arnold) **10.** Glycidic acid amides with hypnotic properties (Fourneau, Billeter) **10.** Carbethoxy substitution on N of barbitals (Tormey, Humphreys) **10.** Synthesis of choline ester of β-glycerophosphoric acid [physiol. properties] (Arnold) **10.** Chaulmoographosphatides (Arnold) **10.** Heterocyclic local anesthetics (Burtner, Lehmann) **10.**

Handbuch der experimentellen Pharmakologie. Ergänzungs-Werk. Bd. VIII. Edited by **Wolfgang Heubner and Josef Schüller.** Berlin: J. Springer. 184 pp. M. 22.50. Cf. *C. A.* **33**, 756[2].

I—ZOÖLOGY

R. A. GORTNER

pH of tissue fluid in frog muscle at rest and after exercise. N. Rundquist. *Upsala Läkareförens. Förh.* **44**, 263–6(1938–39).—By means of a glass electrode the pH of the tissue fluid from the muscle of a frog at rest and after tetanization was detd. In 25 expts. the mean pH at rest was 7.07 ± 0.025, and after tetanization 6.56 ± 0.024 (difference of 0.51 ± 0.017). B. C. P. A.

Action of eserine on the nerve-muscle preparations of Sipunculus. G. Coppée and Z. M. Bacq. *Ann. physiol. physicochim. biol.* **15**, 949(1939); cf. *C. A.* **32**, 661[1], 7137[6], 8009[9].—Eserine in sea water (1:20,000) increases the response to stimulation of nerve-muscle prepns. of *Sipunculus;* this demonstrates the cholinergic nature of motor innervation in worms. Ruth Berggren

The distribution of water and electrolytes in the blood of dolphins (Tursiops truncatus). Lillian Eichelberger, E. S. Fetcher, Jr., E. M. K. Geiling and B. J. Vos, Jr. *J. Biol. Chem.* **133**, 145–52(1940); cf. *C. A.* **34**, 2049[1].—The data were obtained with blood from live animals under conditions which precluded contamination or post-mortem changes. The oxygen capacity of the blood was 19.1 vol.% and the CO_2 content 30.9 mM per l. Except for the high value for Na (153.3 mM ± 2.4) and the low albumin:globulin ratios (0.6–1.31), the values for the inorg. cations and all other constituents in serum agreed within exptl. limits with those for dog serum. On the other hand, the total base of the red cells is composed mainly of K instead of Na, in this more nearly resembling those of man, but the concn. of K (99.4 mM ± 3.8) is higher than in man. The findings suggest that the blood system of the bottle-nosed dolphin is not appreciably different from that of terrestrial mammals. In this respect the adaptation which these animals have undergone is less pronounced than the structural changes which the cetaceans underwent in order to make their existence compatible with an aquatic environment. A. P. Lothrop

Nutrition and infection of the mussel of Provence (Mytilus gallo-provincialis Lmk.). L. Berner. *Bull. inst. océanograph.* No. 778, 28 pp.(1939).—The mussel eats by mouth, as the org. matter in sea water is too decompd. to be absorbed directly. The mussel is omnivorous, eating diatoms, spicules, marine algae, infusoria, larvae, marine eggs, etc. Five diastases were found in the digestive tract: amyolytic and tryptic enzymes, a lipase and a cytase. Intoxication can occur, due to intolerance or anaphylaxis. Infections are often those of typhoid and paratyphoid fever. Some bacteria are agglutinated by mucus in the digestive tract; others stay in the intervalvar water, the intestines or the glands. The amt. of infection of mussels is high in Italy, especially in the fall. Purification of the water by antiseptics reduces the amt. of infection. Dorothy A. Meyer

Distribution of flavins and certain other fluorescent substances in the skin and eyes of teleosts. Maurice Fontaine and René G. Busnel. *Bull. inst. océanograph.*

No. 782, 18 pp.(1939).—Certain blue fluorescent substances resemble flavin in chem. characteristics, histological localization and their form *in vivo*. They are found in particularly high concn. in eyes of certain fish (teleosts). These substances and flavin are extd. from the macerated tissues in 55% MeOH at 38–40°, centrifuged, and the supernatant liquid shaken with $CHCl_3$. If the $CHCl_3$ ext. shows a yellow, green or blue fluorescence and is oxidized with $KMnO_4$ in AcOH, the resulting fluorescence is due solely to flavin. If the MeOH ext. is not oxidized and a satd. soln. of $Na_2S_2O_4$ is added under ultraviolet light, a blue fluorescence appears. On addn. of too much $Na_2S_2O_4$ the fluorescence disappears. Flavin can be sepd. from the other fluorescent substances by distg. an alc.-water ext. under reduced pressure, adsorption of the aq. liquid on franconite, and elution with a mixt. of pyridine, MeOH and water. Repeat until flavin is completely isolated. Generally, there is more flavin in the eyes than in the skin, but there are species and even individual variations. The relation between the biochem. groups and the systematic position of species in the evolutionary scale is considered. Dorothy A. Meyer

Locus of the action of the galvanic current in the earthworm, Lumbricus terrestris Winnefred E. Bradway and A. R. Moore. *J. Cellular Comp. Physiol.* 15, 47–54 (1940).—It is shown by means of expts. with narcotized earthworms and with those made supersensitive by treatment with nerve excitants that the tropistic effects of the galvanic current are independent of general narcosis. Felix Saunders

Effects of salts upon "spontaneous" activity in the nervous system of the crayfish. C. Ladd Prosser. *J. Cellular Comp. Physiol.* 15, 55–65(1940); cf. *C. A.* 34, 2075⁹.—A soln. contg 0.42 g. K per l. keeps the "spontaneous" activity in isolated abdominal ganglia of the crayfish at approx. the same level as that maintained by blood. When the ganglia are bathed with solns. contg. lower concns. of K the "spontaneous" activity is greatly increased; when they are bathed with high-K solns. the activity is diminished. K acts largely on the no. of active units and only in small part on the frequency of activity of each unit. The relation between "spontaneous" activity and K outside the cells can be described by the normal probability integral. Ca does not antagonize the effects of K on "spontaneous" activity. Change in Na content (±25%) of the soln. is without effect. Whether or not a neurone fires "spontaneously" may depend on the ratio of concns. of K inside and outside the cell. The stimulating action of low K is counteracted by another ion of high mobility, Rb. A rise in intracellular acidity which would increase the free K inside the cell increases the "spontaneous" activity; alky. acts in the opposite direction. F. S.

Excystment of protozoa. Isolation of crystalline excystment factors for Colpoda duodenaria. Arthur N. Prater and A. J. Haagen-Smit. *J. Cellular Comp. Physiol.* 15, 95–101(1940).—Two *cryst. compds.* were isolated from the leaves and tops of corn plants. One has the compn. $C_{13}H_{24}O_2$ and m. 61.0–1.5°; the other has the compn. $C_{26}H_{44}O_2$ and m. 125.5–7.0°. These substances are active in promoting excystment of *C. duodenaria* in dilns. of 1 part in 25–50 million when tested in the presence of suitable cofactors. The cofactor effect necessary for this excystment-producing activity can be supplied, at least in part, by a carbohydrate soln. and suitable combinations of adenylic acid, nicotinic acid, nicotinamide, K citrate and malate, and thiamine. Felix Saunders

Differentiation of two principles from the crustacean sinus gland. F. A. Brown, Jr., and H. H. Scudamore. *J. Cellular Comp. Physiol.* 15, 103–19(1940).—A comparative survey of the effects of sinus gland exts. from 7 different species of crustaceans on the red chromatophores of *Palaemonetes* and the black chromatophores of *Uca* was made. The exts. from the different sinus glands show dissimilar relative effects on the 2 chromatophore types which cannot be explained in terms of different concns. of a single chromatophoric substance found in all the sinus glands. All sinus glands investigated yield an EtOH ext. which has strikingly different properties from a water ext. of the alc.-insol. residue. The effects of the whole sinus gland exts. can be explained in terms of different ratios of these 2 components. There is no evidence to support the statement that boiling activates eyestalk ext. A quant. examn. of the effects of boiled and unboiled exts. of *Carcinus* sinus glands shows no significant difference between their activities. Felix Saunders

Total nitrogen content of the Arbacia egg. Robert Ballentine. *J. Cellular Comp. Physiol.* 15, 121–2(1940).—*A. punctulata* eggs contain 26.8 mg. N/cc. cells, 0.107 mg. N/mg. dry wt., 5.86 mg. N/10^6 cells, 265 mg. dry wt./cc. cells and 58 mg. dry wt./10^6 cells. Felix Saunders

Heavy water and longevity. H. G. Barbour and F. S. Hammett. *Science* 90, 538–9(1939) —D_2O up to 10% retards growth activities of *Obelia geniculata*. Regressive and senile stages are also retarded so that life is prolonged. Felix Saunders

Effect of diet on eye-color development in Drosophila melanogaster. E. L. Tatum and G. W. Beadle. *Biol. Bull.* 77, 415–22(1939); cf. *C. A.* 33, 2229⁹.—The production of v^+ eye-color hormone and development of pigment in the double-recessive vermilion brown of *D. melanogaster* may be brought about by feeding the larvae on suboptimal levels of dead yeast under aseptic conditions. At 17° the starvation effect is intensified, and at 28° it is decreased. Carbohydrates, acetates, fat and EtOH, under aseptic conditions, completely inhibit the starvation effect by direct action on larval metabolism and development. Proteins and amino acids have very little influence but lower the carbohydrate level required completely to inhibit pigment production. The starvation effect is always assocd. with prolongation of larval life, but great prolongation of life is possible without any modification of eye-color. Walter H. Seegers

The nutritional biology of Amphioxus lanceolatus. P. B. van Weel. *Pub. staz. zool. Napoli* 16, 221–72(1937) (in German).—The anatomical aspects of feeding are described. The pH along the gut was: gills, 8.2–8.5; stomach and cecum, 6.3–6.8; intestines, 7.5–8.0. Fats are absorbed phagocytically, principally into the wall of the cecum. No phagocytosis of raw or cooked starch was observed, but broken granules are apparently hydrolyzed in the lumen to some extent. Glycogen was demonstrated histologically in several tissues. Proteins are mainly phagocytized but are possibly slightly hydrolyzed in the lumen. Phagocytosis is but little affected by the elec. charge of particles. No reserve deposits of fat or protein were found, although after fat feeding the fat content of the notochord temporarily increased. 91 references. W. C. Tobie

12—FOODS.

H. A. LEPPER

Glycine determination in foodstuffs. Karl Brecht and Gerolf Grundmann. *Biochem. Z.* 302, 42–9(1939).—Hydrolyze 3–6 g. protein with 20% HCl (in ratio of 1:20) for 40 hrs. Add about 1 cc. benzaldehyde for every 3 g. protein and distil at about 70° *in vacuo* to remove HCl and benzaldehyde. Add to the pulp 100 cc. H_2O, a little BuOH and make alk. with $NaHCO_3$. Remove NH_3 by evapg. to 20 cc. in a 30-mm. Hg vacuum at 35°, and check with Nessler's reagent. Filter off the pptd. NaCl, wash with 70% alc. and neutralize with HCl. Evap.

again *in vacuo* to about 10 cc., filter, wash with alc. and dil. to 50 or 100 cc. If all the fat was not removed by hydrolysis, ext. the soln. with ether in a separatory funnel. It is recommended, however, to defat before performing the hydrolysis. Add 0.5 cc of the soln. to 2 cc. of a mixt. of 25 parts *M*/15 phosphate buffer, pH 8, and 75 parts of a freshly prepd. aq. soln. of *o*-phthalaldehyde, shake well and 2 min. later add 2 cc. of a freshly prepd. mixt. of 5 parts concd. H_2SO_4 with 30 parts 95% alc. After 2 min. add 5 cc. $CHCl_3$ and shake 1/2 min. Pipet off 3 cc. of the $CHCl_3$ layer, add 0.5 cc. 95% alc. and exam. in a step photometer using filter S_{72}. Prep. a calibration curve; the values of the extinction coeff. follow a linear course only within a range of 150 to 600 γ. Data on the glycine content of a no. of foodstuffs are presented. S. Morgulis 1

Flavin (vitamin B_2) content of foodstuffs. M. Sumi and Z. Tuzuki. *Bull. Inst. Phys. Chem. Research* (Tokyo) **17**, 1296–9(1938).; cf. *C. A.* **34**, 2072⁵.—The flavin content of mushrooms, fermentation products (soya-miso, soy sauce and liquors), and milk has been detd. photochemically. B. C. P. A. 2

Experiments with the insecticide "Littacid-liquid." K. Göpp. *Wochschr. Brau.* **56**, 90–3(1939).—The conclusions are very favorable for the use of this insecticide if 3 days are given after spraying and drying before the grain is stored in order to ventilate the storage. S. Józsa 3

Chemical and technological examination of the Lybian barley. Spartaco Copertini. *Agr. coloniale* (Italy) **33**, 626–34(1939).—Analyses are given of barley samples collected in the years 1935–1937 in 4 provinces of Lybia. The min. and max. values are, resp.: H_2O 9.53, 13.6; total N 1.00, 2.03; H_2O-ext. 63.5, 78.1; ash 1.06, 4.28%. G. A. B. 4

Simple hints on flour analysis. E. Berliner. *Mühlenlab.* **9**, 13–16(1939).—Rye flour in wheat is detected by the pptn. of characteristic threads from the flour ext. by $COMe_2$. Bean flour coagulates Fe_2O_3 sols in a similar manner to aleurone cells. Corn is detected by swelling in paraldehyde or by lack of staining in mucicarmine. Potato starch is easily recognized under the microscope. The methyl red test for acidity is suitable for microscopical use, and a quick preliminary test for diastase or maltose can also be carried out with Fehling soln., under the microscope. To distinguish between malt and sprouted grain, the flour ext. is heated to 70° before testing. The microscopical examn. of bread for yeast or bacteria is described. B. C. P. A. 5

A new method for the determination of diastatic action of grain flour and factors affecting the diastatic activity. Ivan D. Popov. *Biochem. Z.* **302**, 177–86(1939).—Weigh 5 g. of flour (accurately to 0.05 g.) and suspend in 46 cc. distd. H_2O at 30°. Keep at this temp. for 1 hr., shaking every 15 min., and stop the enzymic action by adding 2 cc. 0.8 *N* H_2SO_4 and 2 cc. 12% Na tungstate. Filter and det. the reducing sugar in 5-cc. aliquots with $K_3Fe(CN)_6$ according to the Blish-Standstedt procedure (cf. *C. A.* **27**, 3533). The amt. of maltose is obtained from a table. The diastatic activity of 10 g. flour is calcd. by multiplying this value by 20. The effects of diln., temp., fineness of flour and of the germ on diastatic activity have been detd. S. Morgulis 6 7

Bread aroma. I. Determining the biacetyl and acetoin contents in various sour-dough breads and breads made with dough containing acidifying agents. E. Komm and G. Lehmann. *Z. Untersuch. Lebensm.* **78**, 458–64(1939).—The combined contents (I) of biacetyl and acetoin of materials analyzed were: sour-dough bread 0–1.36, bread baked from dough contg. com. acidifying agents 2.01–3.22, wheat-flour bread made with yeast 8.12, sour dough 0.41–0.82 and yeast dough 2.0 mg. %. I in bread ingredients is too small to contribute appreciably to I in finished breads. The results indicate that biacetyl and acetoin were formed during fermentation and chiefly in yeast dough. M. M. Piskur 8

Dairy products, milk and cream. Elmer R. Tobey. *Maine Agr. Expt. Sta., Official Inspections, Bull.* **171**, 123–58(1939).—The chem. compn. and bacteriol. count of 1312 samples of milk and 311 samples of cream are given as a basis for grading these foods. C. R. Fellers 9

Determination of butter, milk and egg content of foods. J. Grossfeld. *Chem.-Ztg.* **63**, 381–3(1939).—The principles underlying such detns. are reviewed. Butter is detd. indirectly from the $PrCO_3H$ value, milk from the milk fat, lactose, Ca, and casein contents, and egg from the lecithin-P_2O_5, choline, and cholesterol contents. B. C. P. A. 10

Preparation of dairy by-products. E. Capstick. *J. Brit. Dairy Farmers' Assoc.* **51**, 50–8(1939).—A review, describing the manuf. of dried and condensed whole and sepd. milk and whey. B. C. P. A. 11

Lactic acid milk in the tropics. J. H. de Haas. *Indian J. Pediat.* **6**, 108–11(1939).—The prepn. of lactic acid milk (fat 2.6, protein 2.3, lactose 3.2, ash 0.5, sugar 4.5, meal 1.6, and H_2O 85%) from fresh or evapd. milk is described. In addn. the milk contains rice meal, sugar, lactic acid, cod-liver oil and ascorbic acid. It is an excellent artificial food for infants who are not, or are only partly, breast-fed. The milk is readily digested, has a high calorific value (700–730 kg.-cal./l.), and can be kept for 24 hrs. at tropical room temp. B. C. P. A. 12

Grading milk by resazurin test. J. G. Davis. *Food Manuf.* **14**, 196–8, 207(1939).—Methods of carrying out this reduction test instead of the longer methylene blue test are described. Rapid reduction of the dye is given by mastitis milk, which must not be confused with milk produced under unhygienic conditions. B. C. P. A. 13

Fiji milk constants. W. J. Blackie. *Agr. J.* (Fiji) **10**, 68–71(1939).—Analyses of 240 samples of milk show that herd milk from the wet dairy areas of Viti Levu has a high percentage of butterfat. The evening milk gives higher results for fat than the morning milk. Seasonal variation in butterfat percentage is not marked. The solids-not-fat are distinctly on the low side even for tropical milk. The mean f.-p. figure for 190 samples is −0.543° and 96% of the samples fall between −0.533 and −0.555°. These f.-p. values are up to temperate country standard. Under Fiji conditions, the f.-p. test is the most reliable method for detecting adulteration. J. R. Adams 14

Accuracy of plate counts made from milk products as affected by the temperature of incubation. Carl S. Pederson and Robert S. Breed. *Am. J. Pub. Health* **30**, 162–4(1940).—It appears to be impossible to make a perfect incubator for milk-control work. Even if one were made and operated at 37°, counts obtained in examn. of milk supplies would be subject to a considerable uncontrolled error. It, therefore, seems logical to change the temp. required for incubation to that temp., i. e., 32°, at which slight variations have no material effect on the plate count and at which the counts obtained from various samples of milk would be a more constant percentage of the total max. count obtainable. Seven references. J. A. Kennedy 15

Recent investigations of goat milk. A. K. Besley. *Am. J. Pub. Health* **30**, 182–5(1940).—Milk from the Toggenburg and Saanen breeds of goats has been found to be a healthful, nutritious food, not unlike the milk from the Holstein breed of cows in general compn. and nutritive value. The goat milk had an av. curd tension considered to be within the upper limits of soft-curd milk, possessing values indicating a curd 31% softer than that of the milk from Holstein cows. A small-sized fat globule of 1/3 the vol. occupied by the fat globule of Holstein milk appeared as another outstanding species difference between the 2 milks. The apparent ability of goats to produce milk exceptionally low in bacterial nos. operates in its favor when milks are appraised on the basis of their microbial content. J. A. Kennedy 16

The deposition of burnt skim milk. W. Mohr and M. Kelting. *Deut. Molkerei-Ztg.* **60**, 1411–12(1939).—Skim milk burns more readily on scratched and damaged than on smooth surfaces. The use of a low gas flame or better still a water bath is recommended. Skim milk preheated above 90° and sterilized skim milk burn on vessels less readily than raw skim milk, which in turn burns on less readily than condensed skim milk. Skimmed sweet 17

cream buttermilk does not burn on as readily as fresh skim milk, an observation which is accounted for on the the basis of the higher lecithin content of buttermilk. Thus the addn. of 0.15 to 0.2% lecithin to skim milk exerts a favorable influence. A. Leviton

Quality control data in the production of preserved milk in the years 1936–38. IV. Milk powder. G. Schwarz and H. Mumm. *Deut. Molkerei-Ztg.* **60**, 1008–10(1939).—Data pertaining to 300 samples of drum-dried skim milk and to 300 samples of whole-milk powder are given. Variations in and average values of moisture, fat, H-ion concn., degree of acidity and soly. are given for the interval 1936–1938. A. Leviton

Determining chlorine in milk. I. M. Zakharchenko. *Molochno-Maslodel'naya Prom.* **5**, No. 4, 7–8(1938); *Chimie & industrie* **42**, 359.—The principle of the method is based on the direct argentometric titration of Cl by Kolthoff's method in presence of adsorption indicators (bromophenol blue) and a certain excess of AcOH. Titration is carried out on the filtrate obtained after addn. to 20 cc. of milk of 25 cc. distd. water and 2–5 cc. of 6% AcOH. A. Papineau-Couture

Determination of water in condensed milk. V. Zimaiev. *Molochno-Maslodel'naya Prom.* **6**, No. 2, 14(1939); *Chimie & industrie* **42**, 719–20.—Water can be detd. in condensed milk by Teichert's method, refractometrically or by the xylene method, provided the result is corrected for lactose. The correction for each % of lactose in the condensed milk is 0.05% for Teichert's method and the xylene method and 0.075% for the refractometric method. A. Papineau-Couture

Low-fat evaporated milk in infant feeding. A. C. Edwards. *Wisconsin Med. J.* **37**, 1004–6(1938); *Dairy Sci. Abstracts* **1**, No. 1, 51.—It is claimed that a low-fat evapd. milk is more satisfactory in infant feeding than the regular evapd. milk. This new product is a half-skimmed evapd. milk, the percentage compn. is fat, 4.08; lactose, 10.50; protein, 7.15; ash, 1.80. It is dild. and a sol. carbohydrate added before use. The method of manuf. is given. C. L. B.

Fat content of whole cheese as a standard. T. J. Drakeley. *J. Brit. Dairy Farmers' Assoc.* **51**, 59–66 (1939).—It is suggested that the fat content be reported on whole cheese and not on dry-matter content and that whole-fat cheese should contain not less than 30% of fat for raw, or not less than 29% for processed, cheese. All other cheese should be labelled with the min. fat percentage and whether processed. It is claimed that this scheme obviates the difficulty in assessing the compositional quality of cheese owing to varying fat and H_2O contents. B. C. P. A.

Fat separation from sour-cream buttermilk. W. Mohr, A. Arbes and M. Kelting. *Molkerei-Ztg.* (Hildesheim) **53**, 2153–5(1939). Using a closed foamless Westphalia centrifuge delivering 1000 l. per hr., the authors obtained a sepd. buttermilk contg. 0.12 to 0.2% fat—this from buttermilk contg. 0.3 to 0.6% fat. It is essential that the sepn. be carried out at low temps. (14°–16°). The buttermilk cream should not contain more than 18–20% fat, and the valves of the centrifuge should be adjusted to obtain this condition. Neither in taste nor in graininess does the sepd. buttermilk differ from the untreated; nor is there any greater tendency toward sedimentation. Buttermilk whose fat content exceeds 1.4% yields sepd. milk contg. 0.4–0.45% fat. A. Leviton

Preparation of milk fat (butterfat) from milk. C. H. Lea and H. P. Hale. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 26–9(1939).—Milk fat was prepared via butter and directly from cream. If the fat is to be used for the reconstitution of milk or butter, evapn. of the water from the cream must be carried out at a relatively low temp. to avoid production of a "butter-toffee" flavor. J. S. Hicks

The applicability of methods for determining biacetyl in sour cream and sour skim milk and the effect of dairy wash water on the biacetyl content of butter. W. Mohr and A. Arbes. *Fette u. Seifen* **46**, 214–17(1939).—Comparative tests, with dil. aq. solns. contg. known amts. of biacetyl (I) and with butter, showed reasonably good agreement between the method of M. and Wellm (*C. A.* **32**, 8025[1]) and the rapid method of Schmalfuss and Werner (*C. A.* **32**, 4677[7]). When milk or cream was treated with certain metal salts and then (*a*) soured and stored for approx. 20 hrs. or (*b*) allowed to sour during such storage, the I content was increased over that of the control sample without addn. of metal salt. The metal salts tested were, in order of increasing effectiveness, $CuCl_2$, $MnCl_2$, $FeCl_3$ and a combination of all 3. The salts were added in amts. of 0.5–2 mg./l. of milk or cream. Addn. of the salts to cream or milk immediately before detg. I was without effect on the results. Washing butter with water contg. 0.5–1.5 mg./l. of various salts of Fe, Mn and Cu had no effect on the I content of the butter. J. W. Perry

Effects of tomato juice on the production of flavor contributants in butter cultures. Clement W. Abbot. *Iowa State Coll. J. Sci.* **14**, 3–5(1939).—Fresh tomato juice or pulp or sliced tomatoes dried in the sun or some samples of canned tomato juice hastened the rate of formation of acetylmethylcarbinol and biacetyl which are assocd. with the aroma of fine butter. No significant concn. of the potency was effected and it seems certain that the citric acid content has but slight effect. F. E. Brown

Rapid objective determination of the flavoring agent of enzymes used in butter making. L. Khikalo. *Molochno-Maslodel'naya Prom.* **5**, No. 4, 25–6(1938); *Chimie & industrie* **42**, 559.—The method is similar to that used for detecting the flavoring agent ("acetoin-biacetyl") in butter. Shake 2 cc. of the enzyme with 2 cc. of 30% KOH soln.; after 15–20 min. when the reaction is pos. there appears a pink coloration which progressively turns red. A. Papineau-Couture

Application of the phosphatase test to butter. E. H. Parfitt, W. H. Brown and G. W. Shadwick. *Am. J. Pub. Health* **30**, 240–6(1940); cf. *C. A.* **33**, 2234[8].—No relation was found to exist between the phosphatase value of the butter and its yeast and mold count, total bacterial count and its keeping quality as measured by drop in score. The agreement secured between 2 labs. on identical samples of butter was closer with the short methods than with the 1-hr. method. A higher percentage of phosphatase pos. reactions was found coming from plants using flash systems of pasteurization than from plants using vat systems. However, some plants which were flash pasteurizing consistently yielded neg. phosphatase reactions; this indicated that the process was not at fault. Owing to the possibility that the enzyme is concd. in butter, and because of the lack of knowledge concerning its partition in butter from cream, further studies on this point are indicated. It has been found that under the conditions which butter is marketed a significant no. of samples will react neg. when fresh, and pos. after receiving treatment comparable to com. methods of distribution. Six references. J. A. Kennedy

Development of the Norwegian margarine industry, 1929–1938. L. Erlandsen. *Allgem. Oel- u. Fett-Ztg.* **36**, 250–3(1939); cf. *C. A.* **34**, 536[3].—A review. Statistics illustrating production and the changes in raw material compn. are quoted. B. C. P. A.

Susceptibility of pig fat to oxidation. C. H. Lea. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 60–4(1939); cf. *C. A.* **33**, 252[3].—Three factors are: the inherent tendency of the particular mixt. of fatty glycerides present to oxidize, the concn. or activity of the natural antioxidants or inhibitors deposited with the fat and the activity of the fat-oxidizing enzyme ("lipoxidase"). The degree of unsatn. as measured by the I value is not necessarily the limiting factor in detg. stability. J. S. Hicks

Rancidity in fats. A. Banks. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 106–12 (1939).—During the storage of frozen herring, the activity of the oxidizing enzyme at the temp. of storage and the change in potency (or concn.) at that temp. are two important factors affecting the development of rancidity. The enzyme is more active in the presence of NaCl, and its

potency is greater the lower the temp., so that −10° is not suitable for the storage of herring. J. S. Hicks

Effect of antioxidants on the stability of vitamin A in ghee exposed to sunlight. N. S. Doctor and B. N. Banerjee. *Current Sci.* 8, 513(1939); cf. *C. A.* 31, 4714.—Although hydroquinone, Na citrate and Na tartrate retard the rate of autoxidation in ghee they do not retard or minimize the destructive action of light on the vitamin A of ghee. The carotene naturally present has no protective action against the effect of light. H. L. M.

The vitamin A content of cheese. Alan W. Davies and Thomas Moore. *Biochem. J.* 33, 1645-7(1939).—English Cheddar cheese in biol. tests showed about 7.5 I.U. per g. vitamin A. This was about the amt. to be expected from its milk fat content and from colorimetric estns. of vitamin A and carotene. Colorimetric detns. on other full-milk cheeses gave similar results. Lower values were obtained for cheeses of lower fat content. E. W. S.

Munster-type ewe-milk cheese. A. S. Kara-Oglanov. *Molochno-Maslodel'naya Prom.* 1939, No. 1, 19; *Chimie & industrie* 42, 717-18.—The manuf. of this cheese is described. Its av. compn. is as follows: H_2O 39.5, fat 35, fat on dry basis 57, salt 3, total N 3.18, sol. N 2.27 and proteins 20.5%. A. Papineau-Couture

The addition of new substances in the manufacture of cheese. W. Scheimpflug. *Molkerei-Ztg.* (Hildesheim) 53, 1964-5(1939).—Gum tragacanth 0.176%, "Johannisbrotkernmehl" 0.513%, and pectin solns. 0.0274% were examd. for stability. Only the pectin soln. was found to be free of sediment. One part of either gum tragacanth or "Johannisbrotkernmehl" formed a gel with 30 parts H_2O. These observations formed the basis for the conclusion that neither the gum nor the "Johannisbrotkernmehl" could be used in the manuf. of cheese with the same favorable results obtained with pectin. A. L.

Methods of improving egg quality. L. A. Wilhelm. *Poultry Sci.* 19, 3-8(1940); cf. *C. A.* 33, 9394[5].—Eggs of known albumin index were prepd. for storage in several ways, namely, in standard 2 by 6 egg cartons (I), sealed in airtight containers under normal atm. conditions (II), sealed in airtight containers in an atm. of CO_2 (III), sealed in containers under vacuum (IV) and subjected to a vacuum with release of the vacuum with CO_2 before the container was sealed (V). The containers were stored at 30, 50, 70 and 90°F. None of the treatments was superior to I for short-time holdings at the usual storage temp. (30°F.). When eggs were held at temps. above 30°F., II effectively reduced quality losses from those in I, III, while resulting in a turbid albumin, was effective in preventing the loss of interior quality even at high temps. IV was superior to I but had little advantage over II and usually resulted in an adhering of the thick albumin to the shell membrane. V did not give results that were consistently superior to those obtained with III. Eggs packed in airtight containers developed molds quite rapidly when held at high temps. unless CO_2 was added. K. D. J.

Dried meat. T. Moran and E. C. Bate Smith. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* 1938, 34-5(1939).—Minced meat dried rapidly at ordinary temp. *in vacuo* over $CaCl_2$ retains its fresh color and flavor and reabsorbs water, so that it is soft and elastic when cooked. J. S. Hicks

Chemical composition of some canned meats. V. Kirillov. *Myasnaya Ind. S. S. S. R.* 9, No. 9, 33-4 (1938); *Chimie & industrie* 42, 721.—Chem. analysis (total N, fat, H_2O, NaCl, ash) of various canned meats (smoked beef, boiled beef, beef tongue, liver pâté) showed that the latter possessed the highest cal. value (336 cal., as compared with 224-245 cal. for the other products examd.) and the highest fat content (28.32% as compared with 12.28-17.09%). A. Papineau-Couture

New method for determining collagen in meat and sausage. N. Krylova. *Myasnaya Ind. S. S. S. R.* 10, No. 6, 29-32(1939); *Chimie & industrie* 42, 721.—The method is based on extn. of the collagen in the autoclave (after sepn. of the plasma proteins) for 2 hrs. under 1.5 atm. After concn. of the filtrate, alc. is added, then $CuSO_4$, and N is detd. in the ppt. by Kjeldahl's method. A. Papineau-Couture

Use of nitrites and nitrates in preservation of meat. J. Sampaio Fernandes. *Rev. soc. brasil. quim.* 7, 184-9 (1938).—After clarification with tannic acid, nitrate ion is detd. by $OHC_6H_4SO_3H$. The soln. is distd. to small bulk and nitrite ion detd. in the distillate. B. C. P. A.

Modification undergone during storage by meat frozen by various processes. N. Golovkin. *Myasnaya Ind. S. S. S. R.* 10, No. 2, 29-34(1939); *Chimie & industrie* 42, 654.—In meat that has been frozen by the accelerated process, formation of lactic acid during storage is smaller than in meat frozen by the standard process, rapid cooling retarding the decompn. of glycogen. Though variations in the physicochem. consts. seem to indicate that meat which has been frozen rapidly keeps less well, organoleptic tests would seem to indicate the contrary. This contradiction is due to the fact that, in rapidly frozen meat, decompn. of glycogen and of lactic acid plays a relatively unimportant part, the crust protecting the meat against the development of the microflora. A. P.-C.

Swelling of quick-frozen and slow-frozen meats. S. P. Bystrov. *Kholodil'naya Prom.* 17, No. 1, 41-2 (1939); *Chimie & industrie* 42, 807; cf. *C. A.* 33, 3474[6].—Quick-frozen meat swells more than slow-frozen meat. It can be deduced that quick-frozen meat undergoes less change than meat which has been frozen progressively. When frozen meat is swollen in buffer solns., equil. is reached in 24 hrs. A. Papineau-Couture

Meat packing plant installations for the treatment of wastes. G. L. Childress. *Proc. Texas Water Works Sewage Short School* 21, 129-33(1939).—See *C. A.* 33, 8841[5]. J. E. D.

Oil used in packing sardines. Elmer R. Tobey. *Maine Agr. Expt. Sta., Official Inspections Bull.* 171, 163-5 (1939); cf. *C. A.* 33, 7414[6].—All 50 samples of cottonseed oil used for packing sardines contained less than 0.05% dissolved moisture and 0.10% free fat acid. C. R. Fellers

Shellfish. Elmer R. Tobey. *Maine Agr. Expt. Sta., Official Inspections Bull.* 171, 166-9(1939).—Clams opened under proper conditions, washed but not soaked, show an analysis of free liquids not more than 10%, solids on the drained meats not less than 16% and a score not exceeding 50. In 72 samples examd., the free liquid varied from none to 20.56%, with only 2 exceeding 10%. Fifteen samples contained less than 15% solids on the drained meats. Shucked oysters showed 11.27-17.56% solids on the drained meats. C. R. Fellers

Spoilage of fish. J. M. Shewan. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* 1938, 79-87 (1939).—By the borate distn. method, spoilage was followed over a period of 25-30 days and was found to proceed quite differently in the 3 species studied. Both secondary amines and tertiary amines can be used as indexes of freshness in haddock stowed in ice. Perch and dogfish spoilage were also studied. J. S. Hicks

Electrometric titration of fish's muscle. C. L. Cutting. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* 1938, 89-95(1939); cf. *C. A.* 33, 2526.—A study of perch, pike, trout and haddock did not explain the loss of buffering capacity in fish's muscle during cold storage. J. S. Hicks

Cold storage of herring. A. Banks. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* 1938, 95-6 (1939).—The peroxide values of the fish stored at −30° ranged from 0.2 to 1.0 (ml. 0.002 *N* thiosulfate per g. of fat). J. S. Hicks

Production of volatiles by apples: effects of temperature, maturity, technique of estimation, etc. F. Kidd and C. West. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* 1938, 136-9(1939).—There was no evidence that accumulations of volatile matter and of CO_2 such as may normally be met with in ordinary storage or cold storage depress the production of volatile matter. J. S. Hicks

Gas storage of Cox's orange pippin apples on a commercial scale. F. Kidd and C. West. *Dept. Sci. Ind. Re-*

search (Brit.), *Rept. Food Invest. Board* **1938**, 153–6 (1939); cf. *C. A.* **34**, 1855.—After 5 months' storage the amt. of wasty fruit in 5% CO_2 + 2.5% O was only about 15%, as compared with 47% in air controls and 54% in 5% CO_2 + 16% O. J. S. Hicks

Rise in insoluble ("protein") fraction of the total nitrogen during the climacteric in apples and pears, and effect on this phenomenon of retarding the climacteric by carbon dioxide or stimulating the climacteric by ethylene. F. Kidd, C. West and A. C. Hulme. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 119–25 (1939).—In air, "protein" N increases at the expense of sol. N during the climacteric rise in respiratory activity. When the climacteric is delayed by CO_2, the rise in "protein" N is also delayed. Whether the climacteric is induced by C_2H_4 or whether it occurs normally, the parallelism between the respiration-climacteric and the increase in "protein" N holds. J. S. Hicks

Alcohol-insoluble (protein) nitrogen fraction of the apple fruit. A. C. Hulme. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 125–7(1939); cf. *C. A.* **33**, 1991.—Extn. under reflux on a boiling water bath with 0.25% NaOH for 1.5 hrs. caused 82% of the N of the tissue to go into soln. At pH 3.5 a brownish red ppt. formed, which represented 80% of the N of the ext. This material gave a strong xanthoproteic reaction for protein and also a pos. test for P. On acid hydrolysis, the hydrolyzate gave strongly pos. tests for tyrosine and arginine. J. S. Hicks

Relationship between protein content and rate of respiration in the cell of the apple. A. C. Hulme and W. H. Smith. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 127–8(1939).—The rate of respiration is approx. proportional to the content of alc.-insol. ("protein") N. J. S. Hicks

Grape-wastage investigations, 1938. J. M. Rattray. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 65–74(1939); cf. *C. A.* **33**, 9471.—Wastage of grapes in storage, caused by *Botrytis* infection, was considerably less in bunches wrapped in sulfite paper than in those wrapped in Crystalline paper. K. D. Jacob

The use of alkyl chloramines and tertiary alkyl hypochlorites as volatile preservatives for grapes. J. E. Van der Plank and J. M. Rattray. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 74–6(1939).—Diethylchloramine (0.18–0.35 cc. in 0.65–0.82 cc. triacetin) and tertiary butyl hypochlorite (0.1–0.4 cc. in 0.8–1.9 cc. mineral oil or 0.2 cc. in 0.8 cc. of triacetin or ethylene glycol diacetate), impregnated into plugs as solns. in mineral oil or in nonvolatile satd. esters, were sufficiently volatile and fungicidal to control *Botrytis* waste in table grapes. In some cases the grapes exhibited a definite off-flavor after storage, while in others there was no off-flavor or odor of the preservative. K. D. Jacob

A device for the regulated release of sulfur dioxide in packages of stored table grapes. J. E. Van der Plank. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 76–8(1939).—An intimate mixt. of finely divided, dehydrated $Al_2(SO_4)_3$ and $NaHSO_3$ is stable when dry, but gives off SO_2 as water is absorbed from humid atms. Evolution of the SO_2 is controlled either by (1) enclosing suitable amts. of the mixt. in packets of varying permeability to water vapor, (2) reducing the absorbing surface of the packet or (3) including within the packet a hygroscopic substance capable of temporarily withholding water from the hydrolytic reaction (an excess of dehydrated $Al_2(SO_4)_3$ is suitable for this purpose). Two types of containers suitable for holding the reagent are described and exptl. results obtained therewith are given. K. D. Jacob

Further investigations of factors affecting "drop" and desiccation of stalks of Waltham Cross [grapes] in storage. E. Beyers. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 79–87 (1939); cf. *C. A.* **33**, 9471.—The amber color and good amber color and good flavor of high-quality Waltham Cross grapes necessitate picking at a stage of maturity slightly more advanced than the min. requirements for the sugar:acid ratio and this tends to reduce drop after storage, but undue delay in picking results in deterioration of keeping quality in other respects. K. D. Jacob

Composition and by-products of pineapples. J. C. Bodenstein. *Farming S. Africa* **12**, 437, 448(1937).—Analyses of pineapple juice are recorded and discussed. The ash of the juice contains approx. 50% K_2O. The CaO content is approx. 3 times that of MgO. A neg. correlation exists between the K_2O and CaO values. B. C. P. A.

Treated wraps for the prevention of fungal rotting. R. G. Tomkins. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 186–9(1939).—Wraps treated with *o*-phenylphenol and either benzidine or hexamine do not injure oranges and retard rotting due to *P. digitatum*. The most suitable proportions to use are 35 parts hexamine to 170 parts of *o*-phenylphenol. J. S. Hicks

Dipping for the control of fungal rotting of citrus fruit. J. C. Fidler and R. G. Tomkins. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 189–90 (1939).—Two % borax solns. were much more effective with the addn. of 1% NaOH in reducing rotting due to green mold, and dipping oranges in 2% NaOH reduces the mold as effectively as dipping in 5% borax, and leads to less injury to the skin. J. S. Hicks

The use of wraps impregnated with *o*-phenylphenol against decay in oranges. J. E. Van der Plank and J. M. Rattray. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 142–5(1939); cf. Tomkins, *C. A.* **32**, 5521.—*Penicillium* decay of oranges was reduced by the use of wraps impregnated with *o*-phenylphenol (3 g./100 sq. ft. of paper), but there was severe scalding of the rind and this injury was not prevented by the use of tech. white rose mineral oil 25 cc. or paraffin wax 56 g./100 sq. ft. of paper as solvents. Appreciable amts. of *o*-phenylphenol remained in the papers for some weeks and its retention was not affected by the presence of mineral oil or paraffin. K. D. Jacob

Dipping experiments with oranges. J. M. Rattray. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 170–6(1939).—Wyandotte Sterichlor (contg. 16% of Na *N*-chloro-*p*-toluenesulfonamide), Shirlan WS (contg. about 66% of Na salicylanilide), *o*-phenylphenol, *p*-phenylphenol, trichlorophenol, dichloro-*o*-cresol, Na *o*-phenylphenoxide, Na 2,4,5-trichlorophenoxide, Na chloro-*o*-phenylphenoxide and Na tetrachlorophenoxide were compared as disinfectants for oranges that had been suitably wounded and heavily loaded with spores of green mold. In general, the best controls were obtained with Shirlan WS (0.5% plus 0.03% of Agral 2), *o*-phenylphenol (0.5% plus 0.03% Agral 2 plus NaOH) and Na *o*-phenylphenoxide (0.02–0.08%) used at temps. of 95–109° F. The *o*-phenylphenol was injurious to the oranges. K. D. Jacob

Comparative study of quality in oranges from Louisiana and other states. W. D. Kimbrough and Guy Noel Page. *Louisiana Agr. Expt. Sta., Bull.* **311**, 3–16(1939).—Satsuma oranges are seldom exceeded in quality by sweet or navel oranges. La. oranges surpass all others in flavor of the juice. The rinds are thin. The percentages of sol. solids and total sugars are fully as high as fruit from other citrus-growing areas. Analyses of various varieties are given. Ascorbic acid values are not given. C. R. F.

The storage of lemons. J. E. Van der Plank, J. M. Rattray, P. A. Crous and J. Kriel. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 156–69(1939).—Fruit which had been picked moderately green developed more extractable juice, sol. solids and acid if stored at a temp. near 50° F. K. D. J.

Transformation of pectic constituents of plums during normal and abnormal ripening. C. S. Hanes and T. N. Morris. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 129–32(1939).—In each pick there was a gradual decrease in the content of total pectin; in fruit of the immature and mature picks there occurred an increase in sol. pectin at the expense of the insol. pectin

fraction, whereas the sol. pectin of the fully ripe pick remained const. over the short period during which these fruits became overripe. The sol. pectin of plums normally becomes much less viscous in character when the fruits pass from the immature to the mature stage, either while attached to the tree or during storage at temps. at which normal ripening occurs. J. S. Hicks

Sorbitol in pears and its conversion during storage into fructose units. F. Kidd, C. West, D. G. Griffiths and N. A. Potter. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 132–6(1939).—Sorbitol was estd. by the prepn. of the dibenzal deriv., which was hydrolyzed by boiling with 5% H_2SO_4. As a further means of identification, hexaacetylsorbitol was prepd. from the sorbitol obtained from the benzal compd., by heating with Ac_2O in the presence of a few drops of pyridine. Much of the sorbitol is converted into fructose units. J. S. Hicks

Rate of respiration and production of volatiles of conference pears: effects of treatment with ethylene, temperature and wounding. F. Kidd and C. West. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 139–42(1939).—A 3-day application of C_2H_4 to pears 2 weeks after gathering caused the immediate onset of the climacteric and a corresponding rise in the rate of production of volatile matter. The rate of production of volatile matter does not increase with temp. over the usual biol. range, but appears to be at a max. at 5–10°. J. S. Hicks

Production of a physiologically active vapor by unripe pears. R. Gane. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 142–3(1939).—William's Bon Chretien pears, when hard and green and without any yellow color, stored at 0°, evolve a vapor that causes bananas to ripen. J. S. Hicks

Melon-storage investigations, 1938. J. M. Rattray. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 55–65(1939); cf. *C. A.* **33**, 9470⁹. —Wastage, particularly in melons stored at 45°F., was not reduced by dipping Honeydew melons for 1–5 min. in either Shirlan WS (1% soln. plus 0.05% of Agral 2) or Na *o*-phenylphenate (0.1% soln. plus 0.05% Agral 2) at either 75° or 110°F. K. D. Jacob

Gas storage of English-grown Doyenne du Comice pears. F. Kidd and C. West. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 157–60(1939); cf. *C. A.* **33**, 254⁵.—The max. storage life obtained was about 5 months in gas storage, as compared with approx. 4 months in air at the same temp. The incidence of brown-heart is related to the degree of maturity of the fruit when placed in gas storage. J. S. Hicks

Gas storage of Monarch plums. W. H. Smith. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 161–5(1939).—When stored at 45° F., a reduction in the concn. of O_2 to 5%, with or without 2.5% CO_2, wastage from rots and breakdown were considerably reduced. A storage temp. of 34° F. is optimal for these plums. J. S. Hicks

The biochemistry of figs. A. K. Salkova. *Sovet. Subtropiki* **1938**, No. 10, 48–9; *Chimie & industrie* **42**, 563.—Of the various methods of drying figs, sun-drying gives the most satisfactory results and is least injurious to the flavor of the fruit. It is useful to fumigate the fruit with S before drying in order to prevent acidification. The sugar content of figs does not increase with age; it depends only on the amt. of sunlight to which they were exposed, degree of ripeness, etc. A. Papineau-Couture

Storage of plums. Rees Davies, W. W. Boyes and D. J. R. de Villiers. *Union S. Africa, Dept. Agr. & Forestry, Rept. Low-Temp. Research Lab.* **1937–38**, 13–28 (1939); cf. *C. A.* **33**, 3014⁹.—Prestorage treatment of Kelsey plums in high concn. of CO_2 (30%) did not assist color development and ripening after storage. Storage in high concns. of O_2 (40–80%) had no effect on the rate of ripening or on the incidence of internal breakdown. K. D. Jacob

Does the quinhydrone procedure yield false pH values for fruit juices, silage, etc.? Holger Jørgensen. *Biochem. Z.* **302**, 281–6(1939).—The quinhydrone electrode is shown to be specially suited for the study of the pH of fruit juices, and results obtained by this procedure agree within about 0.1 of a pH unit with the glass-electrode detns. S. Morgulis

Gas-storage of broccoli. W. H. Smith. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 202–8(1939).—At 38° F. the broccoli kept best in the atm. contg. 10% of CO_2 and 5% O_2. The more preferable storage temp. of 32°F. indicated that a storage life of 4 weeks might reasonably be expected in an atm. contg. 10% of CO_2 plus 10% of O_2. J. S. Hicks

Variety and strain of Alaska and sweet types of peas for canning in Maryland. C. H. Mahoney, W. A. Frazier, H. A. Hunter and Albert White. *Maryland Agr. Expt. Sta., Bull.* **425**, 219–34(1939).—Varietal tests were correlated with canning quality, especially with tenderness as detd. by a *tenderometer*. The several Alaska strains had approx. the same degree of tenderness and quality. The sweet varieties must be harvested at a relatively immature stage to obtain satisfactory quality. C. R. Fellers

Determining the grade of peas from the raw product. E. P. Walls, W. B. Kemp and H. L. Stier. *Canner* **90**, No. 15, 28–30(1940).—From tenderometer readings on the raw peas it was possible to predict with a fair degree of accuracy the grade of the canned product. There was closer correlation in the smaller sizes of peas than in the larger sizes. Texturemeter readings were not as reliable in grade prediction as tenderometer data. C. R. F.

Reducing substances in the potato. F. A. Isherwood. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board* **1938**, 198–9(1939); cf. *C. A.* **33**, 2568.—Besides tyrosine, a small amt. of tryptophan is present in the exts. of the potato. Evidence indicates the presence of a second phenolic compd., related to tyrosine, which gives a strongly pos. Millon reaction. J. S. Hicks

Ascorbic acid content of potatoes. S. S. Zilva and J. Barker. *Dept. Sci. Ind. Research* (Brit.), *Rept. Food Invest. Board*, **1938**, 199–201(1939).—Immature King Edward VII potatoes are rich in ascorbic acid, and the content decreases rapidly in storage. In one sample the concn. fell from 38.9 mg./100 g. to 16.0 mg./100 g. after about 3 weeks. J. S. Hicks

The vitamin C content of dried potatoes. Javillier. *Compt. rend. acad. agr. France* **25**, 1093(1939).—Processing of potatoes in the prepn. of vermicelli does not entirely destroy the vitamin. The vitamin C content of the dried potatoes is about 20 mg. per 100 g. and for the untreated potatoes (70% H_2O) is 6 mg. per 100 g. J. R. Adams

Inhibition of sprouting of potatoes. G. I. Grechka. *Spirto-Vodochnaya Prom.* **15**, No. 12, 12–14(1938); *Chimie & industrie* **42**, 564; cf. *C. A.* **34**, 1710⁸.—Treatment of potatoes with chloro and bromo derivs. of aliphatic hydrocarbons for 24 hrs. at a concn. of 1.1000 prevents sprouting for a certain length of time. The bromo derivs. are more effective in this respect than the chloro derivs.; neither affect the flavor of the potatoes nor destroy vitamin C. A. Papineau-Couture

Maple sirup. Elmer R. Tobey. *Maine Agr. Expt. Sta., Official Inspections Bull.* **171**, 159–62(1939).—The moisture, sucrose, ash, Pb no. and Pb content are given for 81 com. brands of maple sirup. The sucrose content varied from 50.89 to 71.1% with an av. of about 66.5%. Eleven samples contained 0.02 or more grains per lb. of Pb. Maple sirup contains not more than 35% water. C. R. Fellers

Flavor in confections. I. The physiological aspects. Talbot Clendenning. *Mfg. Confectioner* **20**, No. 1, 17–19 (1940). **II. Methods of evaluation.** *Ibid.* No. 2, 23–5.—This includes tests (with sucrose and citric acid solns.) and requisites for tasters. **III. Taste-provoking agents.** *Ibid.* No. 3, 21–2.—A review of substances having (1) sweet, (2) sour, (3) salt and (4) bitter tastes. George Ayers

Physical and chemical properties of California honeys. J. E. Eckert and H. W. Allinger. *California Agr. Expt. Sta., Bull.* **631**, 3–27(1939).—Analyses of 37 honey types characteristic of Calif. are given. The av. Calif. honey contains moisture 16.5, total sugars 77.58, levulose 40.41,

dextrose 35.54, sucrose 2.53, dextrin 0.91, ash 0.21, formic acid 0.16 and undetd. matter 4.72%. The levulose/dextrose ratio is 1.17, the wt. per gal. 11.88 lb. and color 49, or extra light amber. The use of the Abbé refractometer gives fairly accurate results for moisture, solids and wt.-per-gal. detns. Heat darkens honey in proportion to the temp., within limits. Since 22.6% of the natural Calif. honeys exceeded the Federal standard of 0.25% ash, a higher ash tolerance should be set in order to prevent discrimination against Calif. honeys. "Honeydew" honeys are made by bees from the saccharine exudates of certain trees and insects, and while they are indistinguishable by analysis, the flavor and color are usually poor. Some samples are also very viscous. They are of value mainly to the bakery trade. C. R. Fellers

Flavoring characteristics of individual cacao varieties. P. S. Lucas and I. A. Gould. *Michigan Agr. Expt. Sta., Quart. Bull.* 22, 12–17 (1939).—Ash and fat contents of cacao samples used for dairy foods were very similar but there were marked variations in their pH values. In general, the stronger varieties of cacao beans having a chocolate flavor of the bitter type were preferred. C. R. F.

Rapid method of determining nitrogen for estimation of protein content of grain and feeding stuffs. H. Schroder and D. Seidel. *Allgem. Mühlen-Ztg.* 42, 215 (1939).—After digesting with a Se mixt. in the usual manner, the dild. and neutralized liquid is treated with CH_2O. This, with the NH_4 salt present, forms $(CH_2)_6N_4$ and H_2SO_4; the latter is titrated. The accuracy is high, even with inexperienced workers. B. C. P. A.

Production and use of Hevea oilcake. L. Enderlin and J. Le Bras. *Rev. botan. appl. agr. trop., Reprint* 17, 175, 268, 22 pp. (1937).—A review is given covering the yield, character and treatment of the seeds and the compn. of the pressed cake with especial reference to HCN. In connection with possible use of the cake for cattle, a comparison is drawn with linseed cake; its use as a fertilizer would be economically unattractive. B. C. P. A.

Fermentation as a method of biologically influencing feeds and productivity of livestock. M. I. D'yakov, N. P. Okladnov and P. M. Kruppennikov. *Soviet Zootechnics* 1, 27–57 (1939) (English summary); *Dairy Sci. Abstracts* 1, No. 1, 8.—Concd. and mixed feeds fermented with yeasts, when compared with silage, gave no increase in milk yields and did not change the compn. of the milk. C. L. B.

Ensiling potatoes and spinach. O. Ulvesli. *Meldinger Norges Landbrukshøiskole* 18, 460–89 (1938); *Chimie & industrie* 42, 569.—Tests on ensiling potatoes were carried out: (1) without any addn., on tubers that had been rasped; (2) by the A.I.V. process, on both rasped and unrasped tubers. The results of nearly all the tests were satisfactory. The exceptions were due to defective moistening in the case of whole potatoes. Ensilage, however, produces a loss in proteins, which is due chiefly to entrainment by the water that drains from the tubers. The protein loss may reach 50% in the 1st case and 30% in the 2nd. An ensilage of spinach carried out according to the A.I.V. process showed a loss of 18% of protein and a certain amt. of waste in the top layer. A. P.-C.

Epidemic of ascending peripheral polyneuritis at Mauritius in March and April, 1938. J. Balfour Kirk and R. Lavoipierre. *Bull. office intern. hyg. publ.* 31, 1480–4 (1939).—This epidemic was probably caused by the ingestion of soybean oil contaminated with tri-*o*-tolyl phosphate. Ruth Berggren

Determination of total acidity in ensiled fodder. M. I. Ivchenko. *J. Applied Chem.* (U. S. S. R.) 12, 1104–8 (in French, 1108) (1939).—The acids were completely extd. by boiling the sample with water for 15 min. A. A. P.

The acidification process in silage. Carlo Arnaudi and Isidoro Politi. *Boll. sez. ital., Soc. intern. microbiol.* 11, 217–27 (1939).—In silage of *Medicago sativa* and *Sorghum saccharatum* the acidity developed is due principally to the enzymic action of microörganisms. G. A. Bravo

Heat-treating cereals and other food products. Logan A. Dils (45% to Robert M. Foster; 50% to H. S. Cramer; and 5% to Douglas McCabe). U. S. 2,185,053, Dec. 26. App. is described, and the use of a mixt. such as one contg. NaCl 91.5–82.5, KCl 3–5, $CaCl_2$ 2–3.5, tribasic Ca phosphate 1–2, $FeSO_4$ 0.5–1.0, LiCl 0.5–1.0, $CaCO_3$ 0.5–3 and $MgCO_3$ 1–2% (suitably at a temp. of about 230–300°) for dry-cooking or roasting cereals, legumes, coffee or other food products, the cooking being followed by flaking or puffing if desired. U. S. 2,185,054 relates to a generally similar process for treating rice, etc.

Dextrinized bread ingredient prepared from potatoes. William S. Bowen. U. S. 2,185,368, Jan. 2. A product intended for use as a yeast activator, gluten strengthener, crust-color improver and aid to moisture retention in making bread or the like is prepd. by cooking potatoes, removing the skins, mixing about 7 parts of the peeled potatoes with about 1 part of a slightly acid mixt. such as one contg. mono-Ca phosphate 62, $CaSO_4.2H_2O$ 10, NH_4Cl 8 and NaCl 20% and with water and heating to about 70–95° to form a smooth paste or liquid which may then be spray-dried.

Device (with slotted telescoping tubes) for taking samples of milk or other fluids. John Sollie. U. S. 2,185,661, Jan. 2. Various structural and operative details.

Stabilizing the natural green color of vegetables such as peas, asparagus or spinach. James S. Blair (to American Can Co.). U. S. 2,186,003, Jan. 9. A method of stabilizing the natural green color of vegetables during canning and storage comprises, blanching the vegetable product in water which has been made mildly alk. by the addition of $NaHCO_3$ at about 82–88°, cooling the blanched vegetables in water which has been made mildly alk. by the addn. of lesser amts. of $NaHCO_3$ than that used in blanching, soaking the blanched and cooled vegetables in a water bath contg. NaCl at room temp. for approx. 3 hrs. to render the product more susceptible to the establishment of an alk. reserve, adding to water a mixt. of Mg and Ca hydroxides to provide a brine, incorporating the treated brine with the blanched product, hermetically sealing the same, and processing the sealed product by heat.

Pectin preservation and extraction. Philip B. Myers

and Wm. W. Cowgill (to Sardik Inc.). U. S. 2,185,472, Jan. 2. Loss of jelly units from pectic raw material such as apple pomace is prevented by soaking the material in a 3–4% aq. soln. of glycerol and then drying the material. Cf. *C. A.* **33**, 7920[4].

Jellies, etc. Gustave T. Reich (to Pennsylvania Sugar Co.). U. S. 2,185,064, Dec. 26. App. is described, and a process which involves removing water from a mixt. of fruit juices and sugar, and inverting the major portion of the sugar content, in separate operations, the inversion of the sugar being effected at a temp. below the b. p. of the soln. before concn. by evapn. of water.

Treated paper suitable for wrapping foods. Arthur Ryner (to Preservators Ltd.). U. S. 2,185,954, Jan. 2. A wrapping or packing material such as paper is treated with a compd. which evolves NH_3 when subjected to the action of CO_2.

Self-sealing waxed paper for bread wrappers. William N. MacDonald and Walter Noble. U. S. 2,185,470, Jan. 2. A continuous strip adapted to be cut during a wrapping operation to form individual self-sealing bread loaf wrappers comprises a continuous strip of waxed paper or the like having an edge portion of one of its surfaces coated with a nonwax adhesive which is nonadhesive at ordinary temps. but which becomes adhesive under heat and pressure, the adhesive being in the nature of a terpene resin whose formula is 6-isopropyl-3-methyl-3,6-endoethylenetetrahydrophthalic anhydride, the adhesive being sealed within the wax coating of the strip, and including water. U. S. 2,185,469 (William N. MacDonald, inventor; to George T. Trumbull) relates to a self-sealing wax-coated paper wrapper comprising a sheet of wax-coated paper folded over the object to be wrapped and having its edges lapped, with the laps having a multiplicity of registering perforations filled with wax integral with the wax of the coating, these wax fillings of the holes forming integral wax rivets which bond to one another and to the coating and rivet the laps to each other.

13—CHEMICAL INDUSTRY AND MISCELLANEOUS INDUSTRIAL PRODUCTS

(PLASTICS, RESINOIDS, INSULATORS, ADHESIVES, ETC.)

A. BRUSON

War gases and toxic substances. Louis Diserens. *Teintex* **5**, 45–54 (1940); cf. *C. A.* **34**, 2489[9].—The prepn., phys. and chem. properties, and physiol. action of the following are discussed: *Respiratory irritants;* $C_2H_5AsCl_2$, $(C_6H_5)_2AsCl$, $(C_6H_5)_2AsCN$, and diphenylaminochloroarsine, *Lachrymators;* $C_6H_5COCH_2Cl$ and $C_6H_5CHBrCN$, *General poisons;* CO, HCN, CNCl, and CNBr. Prepn. of papers and solns. used for the detection of poison gases is discussed and formulas are given. A chart is included which gives the name, formula, phys. properties, action, detection, and disinfection for each of the gases included in the paper. Saverio Zuffanti

Chemical war materials. XIII. Light absorption of eye irritants in short wave length ultraviolet. H. Mohler and J. Sorge. *Helv. Chim. Acta* **23**, 100–3 (1940); cf. *C. A.* **33**, 3482[7].—The absorption spectra from 2500 to 1800 A. are given for the following materials dissolved in hexane: bromoacetone, bromomethyl ethyl ketone, ω-chloroacetophenone, ω-bromoacetophenone, benzyl bromide, xylyl bromide and bromobenzyl chloride. **XIV Spectrographic determination of war materials.** *Ibid* 104–119.—M. and S. give extinction-coeff. curves for 17 poisons in hexane soln. and discuss the applicability of spectral analysis to their detn. **XV. Parachor of β,β′-dichloro diethyl sulfide, β-chlorodiethyl sulfide, diethyl sulfide and thiodiglycol. A simple apparatus for surface tension measurement.** *Ibid.* 119–24.—Surface tension and d. of the above substances were measured at several temps. near 20° and the parachors calcd. These agree fairly well with the theoretical values. A simple capillary-rise surface-tension app. is described. W. E. Vaughan

Prevention of industrial dermatitis, with reference to protective hand creams, soap and the harmful role of some cleansing agents. Joseph V. Klauder, Elmer R. Gross and Herman Brown. *Arch. Dermatol. Syphilol.* **41**, 331–58 (1940). Philip D. Adams

Professional dermatoses and their combating. J. Strandberg. *Acta Dermato-Venereol.* **20**, 613–31 (1939).—"Dowicide" substances used to impregnate wood have caused 75% of all occupational diseases known to the insurance companies. These substances, composed partly of chlorinated compds. of naphthol or phenol and their derivs., are causes of occupational diseases and should be compensated. Maurice M. Rath

The incidence of occupational dermatoses and their causes in the basic industries. Louis Schwartz. *J. Am. Med. Assoc.* **111**, 1523–8 (1938). E. H.

Toxicology, clinical aspects and pathological anatomy of nickel-carbonyl poisoning. O. Bayer. *Arch. Gewerbepath. Gewerbehyg.* **9**, 592–606 (1939).—Among 15 cases of Ni-carbonyl poisoning by inhalation, headache, dizziness, then marked dyspnea, cough, fever, and leucocytosis were observed. The urine and blood contained Ni. Intravenous administration of large doses of glucose in high concn., Ca, strophanthin and circulatory stimulants were useful in treating these cases. Autopsy of 2 fatal cases showed hepatization of the lungs and that the alveoli were filled by fibrin with cellular blood elements almost completely lacking. Ni carbonyl acts as an inhalation toxin on the large surface of the respiratory epithelium and produces the symptoms of a toxic pneumonia. M. M. R.

Examinations of printers and female assistants at machines with sprayers. K. Humperdinck. *Arch. Gewerbepath. Gewerbehyg.* **9**, 559–65 (1939).—Paraffin or gum arabic in alc. and H_2O, used for quick drying of printed matter, caused untoward effects. Asthma, bronchitis, nasal catarrh and eczema developed. Common complaints of headache, fatigue and irritability were partly due to inhalation of the alc. In many cases blood examn. showed increases of eosinophils and lymphocytes. Maurice M. Rath

Dust masks and filters. Efficiency and resistance to respiration. Limits of utility in stone and mineral industries. G. Hass. *Arch. Gewerbepath. Gewerbehyg.* **9**, 97–112 (1938).—Tests of various types of respirators are recorded. Desirable properties of such respirators are discussed. B. C. P. A.

Practical application of industrial exhaust ventilation for the control of occupational exposures. B. F. Postman. *Am. J. Pub. Health* **30**, 149–61 (1940). J. A. Kennedy

Larvicides and contact sprays used in mosquito control. E. I. McDaniel. *Michigan Agr. Expt. Sta., Quart. Bull.* **22**, 32–4 (1939).—Both larval and pupal stages of mosquitoes can be killed with a pyrethrum emulsion made up according to the following specifications: liquid soap (actual soap 40%) 5, fuel oil or high-grade kerosene 95, pyrethrum ext. (20-fold) 5 and water 45 gal. Pour the water into the soap and agitate until a heavy foam is formed. Combine the fuel oil with pyrethrum, then pour into the soap and water and agitate for at least 30 min. The resulting concd. emulsion mixes readily with water. The fuel oil should have the following specifications: sp. gr. 32–37°Bé., flash 150 P. F., cold 0°F. pours, b. 350–675°F., viscosity 50–100 Saybolt per sec., surface tension 20 dynes. The color is straw. In using the stock emulsion it is dild. with 12 parts of water and is used at the rate of about 25 gal. of finished spray per acre. This pyrethrum emulsion will not kill fish or plants in ponds. C. R. Fellers

Investigation of jet and of its plastification. I. P. Losev and B. I. Losev. *Wiss. Werke moskau. mendelejeff. chem.-teeh. Inst.* **1938**, No. 3–4, 85–90; *Khim. Referat. Zhur.* **2**,

No. 1, 108–9(1939).—The Matagan, Zhilkin, Zorin, Caucasus-Dushet, and Anabarsk-Olenev samples of jet can be classified with lignite-sapropelites of the ordinary lignite type known as "Iager" or "Iais." They are easily worked on a lathe and polished. Sp. gr. 1.19–1.232. Moisture content after 5 days 0.132%. The investigated samples are acid- and base-resistant, and are insol. in ordinary org. solvents. They become brittle from the action of H_2SO_4. The main disadvantages of jets are their heterogeneous nature, their low heat cond., and the presence of foreign admixts. which cause changes in their electrolyzing properties. Plastification treatments of jets with pine tar, synthetic rubber, and S caused lowered mech. properties as compared with the initial material. The treatment of jet with superheated steam up to 180° and a further compressing at 250° with a 250 atm. pressure gave samples with a temporary resistance to bending of 300 kg./sq. cm. (ebonite 1100). A preliminary treatment with HCl before compressing is proposed in order to obtain a material suitable for the elec. industry. W. R. Henn

Alkyd resin potentialities from unusual reactants. A. G. Hovey and T. S. Hodgins. *Paint, Oil & Chem. Rev.* 102, No. 2, 9–12, 37–8, 42(1940).—This is a discussion of the possibilities of prepg. glyptal or alkyd type resins from (1) hydroxycarboxylic acids, e. g., lactic, citric, tartaric or gluconic, (2) carbohydrates, (3) polyhydric phenols, (4) phthalic acid isomers and chlorinated derivs. thereof or (5) various other polyfunctional compds. 55 references. J. W. Perry

Vinyl resins. S. D. Douglas. *Ind. Eng. Chem.* 32, 315–19(1940).—Although the strong and H_2O-resistant polymers of vinyl chloride (I) are incompatible with the easily molded polymers of vinyl acetate (II), interpolymers of I and II are clear resins combining the good properties of each pure polymer. For these resins, the tensile and impact strengths, abrasion resistance, and viscosity in soln. increase as the mol. wt. increases, while H_2O resistance, *n*, hardness, and elec. properties remain practically const. For surface coatings (e. g., baked lacquers), a copolymer made with 85–7% I, with mol. wt. from 8500 to 9500, is used. A mol. wt. from 9500 to 10,500 is preferred for coating paper by callendering. The same resin is used for injection molding, radio transcription records, and floor tile. For compression molding, the mol. wt. should be 12,000 to 13,000 and for sheet stock, 15,000 to 16,000 with the resin made with 88–90% I in the latter case. Fibers are made by extruding a soln. of this last resin through spinnerets. Since these have high wet strength and are not attacked by molds, etc., they are of interest in awnings, fish lines, etc. Woven with other fibers, they produce interesting effects, such as crease permanence and crease resistance. The copolymers with mol. wt. 20,000 to 22,000 made with 95% I can be plasticized to rubber-like masses suitable for coating wire. Pertinent patents are listed. Arnold M. Collins

Technology of hardenable synthetic resins. W. Röhrs. *Atti X° congr. intern. chim.* 4, 190–9(1939).—History of the development of applications of synthetic resins in Germany. Arnold M. Collins

New method of obtaining coumarone resin with simultaneous purification of benzene fractions. G. N. Tyutyunnikov. *Coke and Chem.* (U. S. S. R.) 9, No. 1, 31–2(1939); *Chimie & industrie* 42, 536; cf. *C. A.* 34, 1465[2,6].—The method is based on the fact that diene compds.: cyclopentadiene, indene, coumarone, etc., present in crude benzene fractions (solvent naphtha, medium-light fraction) readily react with maleic anhydride, quinone, α-naphthoquinone and similar substances, with formation of high-melting resinous substances. Maleic anhydride, more particularly, gives alkali-sol. products, m. 168–70°, that can replace rosin. A. P.-C.

Linear coefficient of thermal expansion of ambroid. E. W. Yetter. *Rev. Sci. Instruments* 10, 147(1939).—The linear coeff. of expansion of ambroid (used for bushings in a high-pressure ionization chamber) varies from 5.36 to 5.56×10^{-5} from 20° to 60°. B. C. P. A.

The synthesis of plastic masses. III. S. N. Ushakov. *Priroda* 25, No. 7, 29–37; 26, No. 5, 11–20/No. 8, 29–38 (1937); *Chem. Zentr.* 1937, I, 2273; 1938, I, 1006, 4540.—A review. M. G. Moore

Polyacrylic acid glasses. Ernst Jenckel and Erwin Bräucker. *Z. physik. Chem.* A185, 465–8(1940).—Polymerized acrylic acid is a typical glass; this is shown by its temp.-vol. curves in both the sol. and insol. forms. The rate of polymerization of the acid dissolved in xylene was detd. qualitatively from 80° to 250°; below 80° it is immeasurably slow and above 130° it is practically explosive. The mol. wts. of the products obtained below 130° ranged between 21,000 and 17,000, indicating a degree of polymerization of 290 to 240. The behavior in soln. was essentially the same as that without a solvent. T. H. D.

Polystyrene glasses of different chain length and the water-permeability of milled polystyrene. E. Jenckel, K. Ueberreiter and F. Woltmann. *Atti X° congr. intern. chim.* 4, 184(1939); cf. *C. A.* 33, 452[1].—All polystyrenes are glasses which soften without the formation of a new phase and show a break in the vol.-temp. curve which is also characteristic of glass. The freezing range is raised by increase in chain length and broadened by mixing polymers of different mol. wt. Introduction of small mols. (e. g., paraffin oil) into the polymer lowers the freezing temp. and flattens both branches of the vol.-temp. curve. The elastic deformation is analogous to the vol. after-effect in glass and consists of a momentary deformation and a temporary after-effect, whose speed increases exponentially with temp. The modulus of elasticity increases as the temp. rises. The permeability to H_2O increases with temp. After heating above 60°, where the milled sheets shrink, the H_2O-permeability decreases in spite of the greater thickness but increases somewhat if the sheets are mechanically stretched. A. M. Collins

Directions for the preparation and examination of lactic acid raw casein. Walter Muller and S. Lichtenberger. *Deut. Molkerei-Ztg.* 60, 1010–13(1939); cf. *C. A.* 34, 534[7].—Directions are given for the prepn. of lactic acid casein involving the use of butter cultures and sour whey. Methods of examn. are also given. A. Leviton

Rapid determination of moisture in casein. D. Volotovskii. *Molochno-Maslodel'naya Prom.* 5, No. 4, 8–10 (1938); *Chimie & industrie* 42, 359.—The powd. casein is heated in an Al dish over an alc. lamp in a nonaq. medium consisting of paraffin or ceresin to protect the casein against overheating. A. Papineau-Couture

Determination of moisture in commercial casein by Dean and Stark's method. P. Paradnia. *Molochno-Maslodel'naya Prom.* 5, No. 4, 10–11(1938); *Chimie & industrie* 42, 360.—Water is displaced from the casein by means of toluene vapors; the water and solvent vapors condense in the graduated portion of the app.; the emulsion seps. into 2 layers, and the vol. of the lower aq. layer is then read. A. Papineau-Couture

Asbestos industry in 1938. Oliver Bowles and K. G. Warner. *Rocks and Minerals* 15, 82–4(1940). L. S.

Asbestos. O. Jay Myers. *Rocks and Minerals* 15, 3–12(1940).—A discussion of occurrence, mining, manufg. and uses. Leopold Scheflan

Heat insulation for modern American steam power plants. E. T. Cape and W. F. Kinney. *J. Inst. Fuel* 13, 44–9(1939).—Tests for detg. the properties of various insulating materials are discussed and 9 such materials are compared in regard to working temp., installation d. and thermal cond. D. A. Reynolds

The selection of an emulsifier for the preparation of oil emulsions. A. A. Ghellerova. *Farm. Zhur.* 12, No. 1, 22–6(1939); *Chimie & industrie* 42, 868.—Na caseinate is a good emulsifier for oils and can replace gum arabic for this purpose. Emulsions prepd. with caseinate are more stable than those prepd. with gelatin. A. P.-C.

Recovery of used solvents. D. G. Miller. *Ind. Finishing* 16, No. 4, 14–16, 21;. No. 5, 46, 48, 50, 52(1940).—A discussion of distn. of used solvents. George Ayers

Chlorinated derivatives of acetylene. L. Marcheguet. *Méd. usine* 2, 170–90(1939); *Chimie & industrie* 42, 470.—A general review of the physicochem. properties of these

compds., with a discussion of measures required to reduce to a min., health and other hazards. A. P.-C.

Detergents from kerosene. Alkyl amine hydrochlorides. A. R. Padgett and Ed. F. Degering. *Ind. Eng. Chem.* **32**, 486-8(1940); cf. *C. A.* **34**, 1774[1].—The 95–100° (15-mm.) fraction was chlorinated and the 120–135° (15-mm.) fraction (I) of monochlorides collected. I was refluxed with excess $(HO\text{-}C_2H_4)_2NH$ at 185° for 18 hrs., dissolved in Et_2O and $(HO\text{-}C_2H_4)_2NH$ extd. with H_2O. The *N,N-diethanolkerosylamine* (II) was extd. with 5% HCl, liberated with excess NaOH, dried with NaOH and fractionally distd. in 30% yield. A soln. of II in Me_2CO was satd. with HCl to give almost theoretical yield of II-HCl in noncryst. form. By drop nos. of 0.2% solns. laurylamine-HCl is slightly more efficient than Na lauryl sulfate. Both are markedly more effective than *N,N*-diethanollaurylamine-HCl or *N,N*-diethyllaurylamine-HCl which are in turn markedly more effective than II-HCl. The stability of foam fell in the same sequence. F. D. Snell

Chemical treatment in the preparation of "agaroid" from the seaweed Phyllophora nervosa. V. Gryuner and L. Veronyan. *Colloid J.* (U. S. S. R.) **5**, 851–63(1939).—The algae were soaked and then boiled for 4 hrs. The soln. was filtered and cooled; the strength of the 6% gels obtained was measured. The highest strength was observed when the algae were soaked for a short time in a 0.005 *N* acid (H_2SO_3, H_2SO_4, or HCl) and boiled with a 0.001–0.01 *N* soln. of KH_2PO_4, KCl, NH_4Cl, or K_2SO_4. Higher concns. of acids, other salts, and all alkalies have either a small pos. or a neg. effect on the strength. A long soaking in water or aq. solns. is unnecessary. J. J. B.

Modern dental fillings. Hermann Hildebrandt. *Pharm. Zentralhalle* **81**, 25–7(1940).—A discussion of materials entering into dental fillings. H. divides the fillings into 2 classes, metal and nonmetal. W. O. E.

The modern purifier—activated carbon. Joseph Wrench. *Chem. Industries* **46**, 291–5(1940). E. H.

A study of fractional time counts on knockdown in the Peet-Grady chamber. Harold G. Ledeer. *Soap* (*Sanit. Products Sect.*) **16**, No. 3, 99(1940).—The speed of knockdown of different types of household fly sprays was noted by detg. the no. of houseflies knocked down 1, 3, 5, 7 and 10 min. after spraying in the Peet-Grady chamber (*C. A.* **22**, 4734). The max. variation amounted to 30% for all sprays up to 5 min. but by 7 min. 86–100% of the flies were knocked down. Henry H. Richardson

Recent progress in industrial biochemical processes. F. P. Mazza. *Chimica e industria* (Italy) **21**, 663–9(1939).—Catalytic enzymic processes, biol. synthesis of the proteins and fats, the fermentation industries, citric acid, aceto-butyl and butyric fermentation processes, lactic fermentation, cellulose fermentation, prepn. of sorbite, gluconic acid, the action of colchicine on seeds, org. zeolites, Italian lignites and other recent advances are summarized. A. W. Contieri

The nature of patents. Stanley I. Levy. *Chemistry & Industry* **1940**, 159–62. E. H.

Annual report of the Nonmetals Division fiscal year 1939. Oliver C. Ralston, *et al. U. S. Bur. Mines, Rept. Investigations* **3473**, 40 pp.(1939); cf. *C. A.* **33**, 2611[1].—SiC elements with air-ventilated terminals have been used in ceramic furnaces at temps. up to 1310° for 1176 hrs. with 11.2% less power input than required for graphite resistors. The av. increase in elec. resistance for 14 resistors in 1176 hrs. was 46.9%. Resistance of graphite changes little with service and low voltages can be used for high operating temps. Long life of graphite resistors depends on gas-tight assemblies and proper allowances for differences in expansion and contraction between tube (SiC) and resistor during thermal change. Sealing of SiC surfaces with high-temp. glazes and use of Ni and nichrome sleeves over terminal leads increased protection against O. Temp. distribution in periodic elec. kilns for ceramic firing was comparable to that in the best combustion-fired kilns, but temp. control was easier. Plate warpage is being studied; 60% occurred during drying. Better support was given by use of machined and prefired refractory rings than by the use of sand. By flotation of clay washery rejects from Macon, Ga., a concentrate was made that was comparable to coating and filler clays from the washery. Substitution of Am. for English clays in sanitary ware is being studied. A high content of Am. ball clays (25–38%) is required for easy casting. Characteristics of clays for use in oil-well drilling are being studied. An eykometer has been developed in which the static yield point and gel-forming or thixotropic characteristics of clay or mud suspensions can be measured. The slurry-handling problem at coal-prepn. plants is being studied; progress is reported. The most important factor affecting the rate of drainage of water from coal is the size distribution in the coal. A lab. drainage test has been developed. A coal suitable for electrode mfg., hydrogenation, or internal-combustion motors (less than 1% ash) was obtained from 1 Ala. coal at 77.9% yield. A char suitable for removing taste and odor from H_2O was made by activation of coal-mine refuse. The lower the ash, the better the phenol no. High-ash refuse treated with a diln. soln. of NH_4OH, followed by a dil. H_3PO_4 wash in the presence of $AlPO_4$ (best treatment) was 75% as efficient in decolorizing oil at room temp. as a good activated clay, less effective at higher temps. A satisfactory base-exchange material was made from high-coal fractions of refuse. H_2SO_4 digestion at 100° gave a H base exchanger. Autoclaving this with dil. alkali under 11 atm. steam pressure produced a Na exchanger. A grinding machine permitting direct recording of net power is described. Sepn. of feldspar from quartz by agglomerate tabling and flotation was successfully carried out in lab. and pilot plant. A 47% Fe concentrate was obtained from 24% ore (low-P ferruginous sandstone) by scruffing with small steel plate punchings in a ball mill, then floating with cheap sulfate soap in an acid pulp (90% recovery). Several cyanite ores were concd. successfully by flotation; best results were a 99% cyanite – 0.3% Fe_2O_3 product at 96% recovery. Dry-pressed refractories of several grades were made of finely ground cyanite without precalcination if properly bonded and subjected to pressures around 10,000 lb. per sq. in. and 1525–1650°. A satisfactory light-wt. aggregate was made from slate quarry and mill wastes. Si combines with Ca to give compds. that strongly absorb lime; max. amt. was 1.45 mols. CaO per mol. of SiO_2 of 1.35 parts by wt. The principal compd. is $CaO.SiO_2.aq.$ which exists between 0.173 g. CaO per l. and lime satn. or 1.1 g. CaO per l. This compd. absorbs up to 0.45 mol. of CaO per mol. of compd. $3CaO.4SiO_2.aq.$ exists between 0.0506 and 0.173 g. CaO per l. At 0.0506 g. CaO per l. $CaO.2SiO_2.aq.$ appears. It dissolves congruently in H_2O. Excellent refractories were made from olivine of the Pacific Northwest. An embrittlement alarm and detector to duplicate conditions in a riveted boiler seam were developed. Tests show that mixts. of Na_2SO_4 and NaCl or Na phosphate do not offer satisfactory protection against intercryst. cracking. Lignin, quebracho and cutch are effective. Progress in electrostatic sepn. of minerals, particularly of fine powders, is reported. Various types of mineral sepn. are improved by attrition scrubbing. The problems pertinent to the fluid properties of suspensions were evaluated.
Alden H. Emery

Statistical summary of mineral production. Martha B. Clark. *U. S. Bur. Mines, Minerals Yearbook* **1939**, 1–48. **World production of minerals and economic aspects of international mineral policies.** J. S. McGrath. *Ibid.* 49–62. **Gold and silver.** Chas. W. American Society for Testing Materials, Standards, 1939. I. Metals. 1308 pp.; cf. *C. A.* **33**, 5089[5], 5090[6].—*Standards issued or revised in 1939* are given for steel for bridges and buildings; mild steel plates; structural steel for locomotives, cars and ships; structural Ni-, Si- and rivet-steel; structural-quality steel plates for forge welding; boiler and firebox steel for locomotives; C-steel, C-Si steel, Cr-Mn-Si alloy-steel, low-C Ni-steel and Mo-steel plates for boilers and other pressure vessels; C-steel plates of flange and firebox qualities; flange-quality open-hearth Fe plates; boiler rivet steel and rivets; billet-steel and axle-steel bars for concrete reinforcement; com.-quality hot-rolled bar steels; open-hearth C-steel rails; high-C-steel and quenched C-steel joint bars; bars for springs of C steel (with and without special Si requirements), of Si-Mn steel and of Cr-V steel; steel helical and elliptical springs; normalized quenched-and-tempered alloy-steel forgings; wrought-steel wheels; steel tires; C-steel castings for miscellaneous industrial uses; alloy-steel castings for valves, flanges and fittings for service at 750–1100°F.; elec.-fusion-welded steel pipe; lap-welded and seamless steel pipe for high-temp. service; seamless cold-drawn intermediate alloy-steel heat-exchanger and condenser tubes; seamless intermediate alloy-steel still tubes for refinery service; forged or rolled steel pipe flanges for high-temp. service; forged or rolled alloy-steel pipe flanges, forged fittings, and valves and parts for service at 750–1100°F.; alloy-steel bolting material for high-temp. service; C- and alloy-steel nuts for bolts for high-pressure and -temp. service; sheet, strip and plate corrosion-resisting Cr and Cr-Ni steel; Cr and Cr-Ni alloy-steel castings; Zn-coated Fe or steel wire fencing and barbed wire; tests for wt. of coating on Zn-coated Fe or steel articles; rolled wrought-Fe bars and shapes; solid and hollow-rolled staybolt wrought Fe; rolled or forged wrought-Fe blooms and forgings; Fe and steel chain; welded wrought-Fe pipe; wrought-Fe plates; uncoated and Zn-coated wrought-Fe sheets; wrought-Fe rivets and rivet rounds; cupola malleable Fe; ferromanganese; ferromolybdenum; ferrosilicon; ferrotungsten; ferrovanadium; Mo salts and compds.; tests for magnetic properties of Fe and steel; definitions of terms, with units and symbols, relating to magnet testing; Mg ingot and stick for remelting; hot-rolled Cu rods for elec. purposes; hard-drawn, medium-hard-drawn, and soft or annealed Cu wire; tinned soft or annealed Cu wire for elec. purposes; hard-drawn Cu alloy wires for elec. conductors; bronze and Cu trolley wire; Cu cable; Al-bronze and Mn-bronze sand castings; Mn-bronze ingots for sand castings; Cu-Si alloy rods, bars and shapes; Cu water tube; Cu-Si alloy sheet; Cu-Si alloy wire for general purposes; rolled Zn; Ni-Cr and Ni-Cr-Fe drawn or rolled alloy for elec. heating units; accelerated life test for metallic materials for elec. heating; test for linear expansion of metals; test for change of resistance with temp. of metallic materials for elec. heating; test for temp.-resistance consts. of sheet materials for shunts and precision resistors; and a method of bend-testing for ductility of metals. *Tentative standards issued or revised in 1939* are given for high-strength structural rivet steel; Mn-V steel plates for boilers and other pressure vessels; heat-treated C- and alloy-steel track bolts and nuts; hard-drawn-steel, oil-tempered-steel and Cr-V-steel spring wire; steel music spring wire; C-steel and Cr-V steel valve-spring-quality wire; C-steel forgings; C-steel and alloy-steel castings suitable for fusion welding; seamless C-Mo alloy-steel pipe; seamless alloy-steel boiler and superheater tubes; elec.-resistance-welded steel boiler, superheater, heat-exchanger and condenser tubes; alloy-steel bolting materials for high-temp. service; recommended practice for conducting plant corrosion tests; Zn-coated steel wire strand; electrodeposited coatings of Cd, Ni and Cr, and Zn on steel; test for local thickness of electrodeposited coatings on steel; single and double refined wrought-Fe bars; cast-Fe pit-cast pipe for water and other liquids; cast-Fe soil pipe and fittings; pearlitic malleable Fe castings; ferrochromium; spiegeleisen; test for measuring interlamination resistance and lamination factor of Fe and steel; Al for use in Fe and steel manuf.; Al ingots for remelting; Al-base alloys in ingot form for die castings; Al-alloy (duralumin) bars, rods, wire, shapes, sheet and plate; Al-Mn alloy sheet and plate for use in welded pressure vessels; Al-Mg-Cr alloy

sheet and plate; test for dielec. strength of anodized Al; Mg-base alloy ingot for remelting; rectangular and square soft Cu wire for elec. conductors; Cu trolley wire for ind. haulage; leaded-Ni brass and leaded-Ni-bronze alloys in ingot form for sand castings; classification of cast Cu-base alloys; Cu-base alloy forging rods, bars and shapes; brass and Cu pipe; seamless bright-annealed Cu tubing; Cu and Cu-alloy seamless condenser tubes and ferrule stock; brass and leaded-brass sheet and strip; phosphor-bronze sheet and strip; Be-Cu alloy bars, rods, sheet, strip and wire; Cu-Ni-Zn and Cu-Ni alloy sheet and strip; Cu-Si alloy plate and sheet; Ni-Cu alloy plate, sheet and strip; Al-base, Pb- and tin-base, and Mg-base alloy die castings; testing of Ni and Ni-alloy wire and ribbon for electronic tube filaments; test for flexivity of thermostat metals; salt-spray testing of nonferrous metals; classification of austenite grain size in steels; prepn. of metallographic specimens; prepn. of micrographs of metals and alloys including recommended practice for photography as applied to metallography; radiographic testing of metal castings; and test for Rockwell superficial hardness of metallic materials. *Tentative revisions (submitted in 1939) of standards* are given for boiler and firebox steel for locomotives; boiler rivet steel and rivets; tests for magnetic properties of Fe and steel; terms, with units and symbols, relating to magnetic testing; Mn-bronze ingots for sand castings; and Mn-bronze sand castings. **II. Nonmetallic materials, constructional.** 1217 pp.—*Standards issued or revised in 1939* are given for high-early-strength portland cement; methods of chem. analysis and of sampling and phys. testing of portland cement; quicklime and hydrated lime for water treatment; sand for use in plaster; definitions of terms relating to lime and to gypsum; gypsum plasters; methods of testing gypsum and gypsum products; sand-lime building brick; methods of sampling and testing brick; structural clay wall and floor tile; definitions of terms relating to structural clay tile; hollow load-bearing and non-load-bearing concrete masonry units; concrete masonry units for construction of catch basins and manholes; sampling and testing concrete masonry units; fireclay brick for malleable furnaces with removable bungs, for annealing ovens and for stationary boiler service; refractories for construction of incinerators; fireclay and Al_2O_3-diaspore refractories; chem. analysis of refractory materials; tests for cold-crushing strength and modulus of rupture of refractory brick and shapes; definitions of symbols for heat transmission; concrete irrigation pipe; concrete aggregates; light-wt. aggregates for concrete; tests for abrasion of coarse aggregate by use of the Los Angeles Machine, for clay lumps in aggregates, for coal and lignite in sand, for sieve analysis of fine and coarse aggregates, for sp. gr. and absorption of coarse and of fine aggregate, for structural strength of fine aggregate using const. water-cement-ratio mortar, for unit wt. of aggregate, for compressive strength of concrete, for flow of portland-cement concrete, for flexural strength of concrete, and for yield of concrete; methods of securing specimens of hardened concrete from the structure, for making and storing compression test specimens of concrete in the field, and for slump test for consistency of portland-cement concrete; definition of terms relating to concrete and concrete aggregates; granite block for pavements; mineral filler for sheet asphalt and bituminous concrete pavements; medium-setting emulsified asphalt; tests for emulsified asphalts and for ductility of bituminous materials; recommended practice for bituminous paving plant inspection; methods for mech. analysis of soils and for prepg. soil samples for mech. analysis and detn. of subgrade soil consts.; test methods for centrifuge moisture equiv., field moisture equiv., liquid limit, plastic limit and plasticity index, and shrinkage factors of soils; Zn chloride (for use as timber preservative); test for distn. of creosote; Al powder for paints (Al bronze powder); Al pigment paste for paint; reduced Para Red; Para Red toner; Prussian blue; red lead; TiO_2 pigments; Zn oxide; Zn sulfide pigments; Zn yellow; test for relative dry hiding power of white pigments in a linseed oil vehicle; tests for sp. gr. of pigments; chem. analysis of dry Cu_2O, of white pigments, and of Zn yellow pigment; petroleum spirits; testing of drying oils; methods of sampling and analysis of shellac; synthetic Am acetate; Am acetate made from fusel oil; methods of testing sol. nitrocellulose base solns.; tests for relative dry hiding power and spectral apparent reflectivity of paints; thermometers; and sieves for testing purposes. *Tentative standards issued or revised in 1939* are given for chem. analysis of portland cement; building brick; sewer brick; glazed building units; freezing-and-thawing test of brick; solid, load-bearing concrete masonry units; aggregate for masonry mortar; testing of insulating fire-brick for compressive strength, flexural strength, and permanent linear change after heating; load test at high temps. of fireclay and Al_2O_3-diaspore refractories; tests for apparent porosity, water absorption, apparent sp. gr., and bulk d. of burned refractory products; tests for size and bulk d. of refractory brick; definition of terms relating to refractories; chem. analysis of glass sand; hydrostatic pressure test on, polariscopic examn. of, and thermal shock test on glass containers; test for soundness of aggregates by use of Na_2SO_4 or $MgSO_4$; crushed stone and slag for bituminous macadam or concrete base and surface courses; preformed expansion-joint fillers for concrete and testing thereof; test for sieve analysis of mineral filler; sampling stone, slag, gravel, sand and stone block for use as highway materials; asphalt filler for brick pavements; sampling bituminous materials; test for loss on heating of oil and asphaltic compds.; primer for use with asphalt in dampproofing and waterproofing; asphalt mastic for use in waterproofing; bituminous grout for waterproofing above and below ground level; woven cotton fabrics satd. with bituminous substances for use in waterproofing; testing of bituminous mastics, grouts and like mixts.; recommended practice for accelerated weathering test of bituminous materials; test for tar acids in creosote and creosote-coal tar solns.; Zn dust and its chem. analysis; shellac varnishes; test for toluene dilu. ratio of lacquer solvents; test for elongation of attached lacquer coatings with the conical mandrel test app., test for specular gloss of paint finishes; thermometers, and test for softening point (of asphalt, tars, pitches, rosins or resins). *Tentative revisions (submitted in 1939) of standards* are given for testing gypsum and gypsum products; definition of terms relating to gypsum; definitions of fireclay and alumina-diaspore refractories, of symbols for heat transmission and of terms relating to concrete and concrete aggregates; and testing drying oils. **III. Nonmetallic materials, general.** 1175 pp. *Standards issued or revised in 1939* are given for definitions of com. varieties of bituminous and subbituminous coals, petroleum spirits; tests for acid heat of gasoline, burning quality of kerosene, C residue of petroleum products, cloud and pour points, distn. of natural gasoline, gravity of petroleum and its products by means of the hydrometer, knock characteristics of motor fuels, S in petroleum oils by bomb method and thermal value of fuel oil; conversion of kinematic to Saybolt universal viscosity; viscosity-temp. charts for liquid petroleum products; definitions of terms relating to petroleum; testing of molded materials used for elec. insulation; testing of laminated tubes, laminated round rods and sheet and plate materials used in elec. insulation; testing of elec. porcelain; testing of pasted mica used in elec. insulation; chem. analysis of rubber products; sample prepn. for phys. testing of rubber products; test for adhesion of vulcanized rubber (friction test) and of its adhesion to metal; test for hardness of rubber; textile testing machines; general methods of testing woven textile fabrics; tests and tolerances for knit goods; test for fastness of colored textile fabrics to light; Osnaburg cement sacks and tests therefor; tests and tolerances for cotton sewing threads, for carded cotton gray goods, and for spun rayon yarns and threads; test for max. residual shrinkage of silk and rayon woven fabrics; tests and tolerances for yarns spun from wool mixed with fibers other than wool; testing of pile floor covering; bar soap; chip soap; powd. soap; milled toilet soap; white floating toilet soap; sampling and chem. analysis of soaps

and soap products and special detergents; test for particle size of soaps and other detergents; caustic soda; modified soda (sesquicarbonate type); soda ash; and definition of terms relating to soaps and other detergents. *Tentative standards issued or revised in 1939* are given for fuel oils; tests for index of dustiness of coal and coke, for C residue of petroleum products, for color of lubricating oil and petrolatum by means of A. S. T. M. union colorimeter, for distn. of plant-spray oils, for gum stability of gasoline, for loss on heating of oil and asphaltic compds., for sapon. no., for Et_4Pb in gasoline, for vapor pressure of petroleum products and for kinematic viscosity; varnished cloth tape for elec. insulation; testing of varnishes and of flexible varnished tubing used for elec. insulation; method of measuring shrinkage from mold dimensions of molded materials used for elec. insulation; testing of pin-type lime-glass insulators and of glass spool insulators; tests for dielec. strength, power factor and dielec. const. of elec. insulating materials; sampling and testing of untreated paper used in elec. insulation; tests for power factor and dielec. const. of natural mica, for n of transparent org. plastics, for resistance of plastics to chem. reagents, and for indentation of rubber; tension testing of vulcanized rubber; testing of rubber hose and of flat rubber belting; insulated wire and cable of various grades of rubber compd.; rubber sheath compd. for elec. insulated cords and cables; testing of rubber-insulated wire and cable and of sponge-rubber and hard-rubber products; test for viscosity and total solids content; definition of terms relating to textile materials; tests for apparent fluidity of dispersions of cellulose fibers in cuprammonium hydroxide; tests and tolerances for woven tapes, for single jute yarn, and for continuous-filament rayon yarns; testing of rayon staple; tests for bulking thickness of, machine direction of, resin in, and water-sol. acidity or alky. of paper; palm-oil bar soap and chip soap; powd. built soap; alk. soap powder; Na metasilicate; trisodium phosphate; sampling and chem. analysis of special detergents; and definitions of terms relating to soaps and other detergents. *Tentative revisions (submitted in 1939) of standards* are given for testing molded materials, sheet and plate materials, and laminated tubes and rods used in elec. insulation; testing woven textile fabrics; and textile-testing machines. G. G.

Base metals of Rhodesia. B. Lightfoot. *Proc. Rhodesia Sci. Assoc.* 35, 75–82(1938).—A review of developments in the production of Cr ore, coal, Cu, mica, As compds., Pb, W ores, Fe pyrite, Sn ore, limestone, Ni, Zn, corundum, baryte, ochre, Ta, lepidolite and magnesite. K. D. Jacob

The utilization of waste matter. I. Chemical technology of the utilization of waste matter. Fritz Fromm. *Warenkunde* 1, 5–7(1938).—A systematic study of the processes applied in the utilization of waste matter shows that are only 5 types of waste matter: (1) mixt. of the material with undesirable substances, (2) dild. or triturated materials, (3) by-products, (4) damaged goods and (5) garbage and all kinds of worn out goods. There are only 4 principal processes for the utilization of waste matter corresponding to these 5 sources: (1) concn., (2) regeneration, (3) sepn. and (4) transformation. F. Fromm

Methods of testing enameled [copper] wire. J. A. Weh. *Gen. Elec. Rev.* 42, 203–9(1939).—Various phys., chem., and elec. tests, e. g., resistance to cracking on slow and rapid cooling, resistance to H_2O, acids and alkalies, and dielec. breakdown of the enamel film, are summarized. B. C. P. A.

The protective coating film as a scientific problem. A. V. Blom. *Angew. Chem.* 53, 40–2(1940).—A discussion with 13 references. Karl Kammermeyer

Molten-lead, lead oxides, whitelead and lead dry colors. F. W. Eckfeldt. *Penna. Dept. Labor Ind., Safe Practice Bull.* No. 19, 10 pp.(1940). E. H.

Reactions at high pressures. V. S. Gavrilov. Russ. 51,919, November 30, 1937. The temp. and the pressure of reacting gases is lowered by releasing the reaction products through a throttle directly after the withdrawal from the reaction vessel.

Casein plastics. D. N. Vaskevich. Russ. 55,867, Oct. 31, 1939. Paraform or a substance that produces CH_2O is mixed with casein, plasticizers and urea. The product is treated in the usual manner on rollers or other similar equipment, pressed and tanned.

Use of plastic materials such as "asphalt plank" compositions in forming wall slabs or the like. Albert C. Fischer. U. S. 2,185,335, Jan. 2. Products formed of a plastic material subject to cold flow are provided with a plurality of keys in their opposite faces filled with a cementitious material of harder character such as a cement and asbestos compn. to prevent distortion.

Apparatus for extrusion of plastic materials such as rubber sheathing extruded about a wire. James S. Boyle (to Anaconda Wire & Cable Co.). U. S. 2,185,701, Jan. 2. Various structural, mech. and operative details.

Apparatus for cutting and joining thermoplastic sheet material such as that of rubber or celluloid. Ralph L. Penn, Ralph W. Penn and Norman H. Nye (25% to Edwin J. McIlvried). U. S. 2,185,647, Jan. 2. Apparatus for cutting and sealing by use of heat and pressure includes an electrically heated wire directly coming into contact with one side of the material. 1

Apparatus for molding bottles or other articles of plastic materials such as glass. Earl R. Odom (10% to John B. Sisson). U. S. 2,185,678, Jan. 2. Various structural, mech. and operative details. 2

Apparatus for molding articles such as steering wheels, of thermoplastic materials. Dwight M. Anderson (to Standard Products Co.). U. S. 2,186,160, Jan. 9. Various structural, mech. and operative details.

Resinous compositions. Ben E. Sorenson (to E. I. du Pont de Nemours and Co.). Can. 387,247, Mar. 5, 1940. An aliphatic hydrocarbon is added as a precipitant to a soln. of the resinous reaction product of urea, formaldehyde and aliphatic monohydric alc., contg. about 0.5–1.0 mol. of alc. per mol urea. The products may be used for coatings or molding material. 3

Alkyd resins. G. S. Petrov. Russ. 55,831, Oct. 31, 1939. In the prepn. of alkyd resins, the acidic resin obtained in the first stage is mixed with dehydrating, water-sol. salts and the mixt. is hot-rolled and extd. by known methods.

Artificial resins. K. M. Malin, A. M. Nastyukov and M. P. Polyakov. Russ. 56,044, Nov. 30, 1939. Acid sludge is treated with 3–9% formalin (of the weight of the sludge) with cooling, the reaction mass dild. with water, and the condensation product filtered off and treated in known manner. 4

Artificial resins. B. V. Zikeev and V. V. Chernov. Russ. 52,114, Nov. 30, 1937. Phenol-aldehyde condensation products are treated in EtOH with SCl_2 or SCl_4 to effect polymerization. 5

Synthetic resins. Charles G. Moore (to Glidden Co.). Can. 387,025, Feb. 20, 1940. Glycerol is heated and caused to react with a fatty oil and a small proportion of caustic alkali, the product heated and caused to react with phthalic anhydride, and the temp. raised. The products are characterized by low acid no., and their solns. produce a hard tough film having unusual adhesion and durability. Several examples are given. 6

Synthetic resin. G. A. Kotlyarovskiĭ. Russ. 55,866, Oct. 31, 1939. Epichlorohydrin and phthalic anhydride in equimol. proportions are condensed in the presence of tertiary amines at about 100° for 3–5 hrs. The product is heated *in vacuo* at not above 210° until the desired consistency is obtained.

Synthetic resin products. Arthur Haroldson (to Continental-Diamond Fibre Co.). U. S. 2,185,080, Dec. 26. A product convertible by heat into an infusible, insol. state comprises the reaction product of an oil-incompatible, heat-convertible, phenol-formaldehyde resin with a reaction product of a double bond of tung oil and a double bond of an unsatd. aliphatic, dicarboxylic acid having a 7

—CO—C=C— group, such as maleic acid, there being present at the time of the conversion of the oil-incompatible resin into the tung oil-phenol-formaldehyde resin only the oil-incompatible resin and the tung oil-dicarboxylic acid reaction product as substantial reactants, the tung oil-phenol-formaldehyde resin yielding no sepn. of the oil during curing of the resin. 8

Synthetic resin compositions for molding. Silvio Pellerano (to Garfield Mfg. Co.). U. S. 2,185,354, Jan. 2. Compns. suitable for molding and hardening by heating are formed of an inert filler such as asbestos 500–800 parts together with 180–190 parts of a binder made up of an oil such as China wood and linseed oils 8–16, a coumarone-indene resin 16–30, a glycerolphthalate resin 4–8, stearin pitch 40–80, a solvent such as mixed naphthas 12–24 parts, and a small proportion of a plasticizer such as tritolyl phosphate. 9

Phenol-aldehyde resins. G. S. Petrov. Russ. 56,108, Nov. 30, 1939. Phenol-aldehyde resins are prepd. by the repeated condensation of the novolac resins with methylene-contg. substances in acid or alk. medium in the presence of water-absorbing salts (e. g., Na_2SO_4) which are sol. in water but insol. in alc. The resin is sepd. from the salt by dissolving the salts in water or the resin in alc.

Synthetic resin sheathing, etc., for electric cables. Jesse B. Lunsford. U. S. 2,185,558, Jan. 2. A multiconductor suitable for use on shipboard, etc., comprises a plurality of individual conductors, a sheathing of asbestos individually inclosing each conductor, sheathing of synthetic resin inclosing each asbestos sheathing, a second asbestos sheathing inclosing the synthetic resin sheathing, a common asbestos sheathing inclosing the plurality of conductors and the insulation individual thereto, asbestos fiber filling interstitial spaces between the several conductors, a sheathing of synthetic resin of sufficient thickness to have the desired mech. strength inclosing the common asbestos sheathing, a second common asbestos sheathing inclosing the last-mentioned synthetic resin sheathing, and a protecting armor inclosing the latter asbestos sheathing, the resin being resistant to deterioration by storage-battery electrolyte and fumes and by oil, substantially incombustible in the absence of continued application of heat above its kindling temp., permanently flexible and of high dielec. strength.

Resinous laminated sheet material suitable for radio dials, etc. Wesley R. Thompson and Wm. E. Flood (to Catalin Corp. of America). U. S. 2,185,477, Jan. 2. A process of producing flexible laminated sheet material, which is sufficiently nonbrittle to be stamped and punched without fracturing and is stable against changes in dimension with varying moisture conditions, comprises impregnating a fibrous sheet with an alc. soln. of a hardenable phenol-CH_2O resin sol produced by treating 1 mol of phenol with 1.5 to 3 mols of CH_2O in the presence of an alk. catalyst followed by neutralization of the excess alkali and dehydration of the reaction product to produce a hydrophilic sol contg. an appreciable amt. of water and adding alc.; heating the impregnated sheets sufficiently to effect substantial removal of the alc. in the sol, but leaving a substantial amt. of water therein and heating sufficiently to convert the hydrophilic sol into a gel *in situ* on the sheets, the gel having the residual water colloidally dispersed throughout its mass, pressing together the sheets impregnated with the hydrophilic gel and heating the sheets while under pressure to harden the gel into a rigid, infus. cellular form which bonds the sheets together, and retains colloidally dispersed water droplets entrapped in the cells of the cellular mass whereby a laminated sheet material having the specified characteristics is produced. 4

Sheet material such as paper or cloth treated with vinyl-resin. Harold F. Robertson (to Union Carbide and Carbon Corp.). U. S. 2,185,356, Jan. 2. A pervious base sheet of fibrous material is coated to render it substantially greaseproof and waterproof on at least one surface by a smooth, continuous, impervious, preformed film of vinyl resin compn. having a thickness from about 0.0006 in. to 0.001 in. in which the vinyl resin is substantially identical with a resin resulting from the conjoint polymerization of a vinyl halide with a vinyl ester of a lower aliphatic acid and contg. about 80% of vinyl halide, the surface of the base sheet and vinyl resin-contg. film being firmly bonded in permanently fused union so that the resin does not strike through or substantially impregnate the base sheet, in the absence of a solvent for such resin, by heat and pressure at a temp. below about 130° and at a pressure not more than about 250 lb. per sq. in., and the base sheet being unaltered in its fibrous structure. 7

Condensation products of urea or thiourea. E. N. Freidberg and D. D. Chegodaev. Russ. 52,209, Nov. 30, 1937. Urea or thiourea is condensed with butyraldehyde, and the product treated with CH_2O with or without addn. of urea. 8

Shaped polyvinyl chloride articles. I. G. Farbenindustrie A.-G. Brit. 508,851, July 4, 1939. Articles are made from polyvinyl chloride (I) or from an interpolymerizate from vinyl chloride and another monomeric 9

compd. that, if it contains a vinyl group, contains no C to C unsatd. linkage other than in the vinyl group by mixing the I or interpolymerizate intimately with 0.5–5% of S (calcd. on the total wt.) and shaping the mixt. by a thermoplastic method.

Electrical insulating materials. Karl Stuckardt and Reinhold Reichmann (to Westinghouse Elec. & Mfg. Co.). U. S. 2,185,280, Jan. 2. An insulating material is prepd. by mixing Na-Ca silicate 3–7, K fluosilicate 15–30, Al_2O_3 10–15, MgO 25–30, and quartz 25–35 parts, fusing the mixt. at 1310–1360° until it becomes colorless, and then adding K fluosilicate in a further quantity of 2–3 parts.

Metal-sheathed electric conductors, such as sheathed with lead. James D. Burby (to Anaconda Wire & Cable Co.). U. S. 2,185,429, Jan. 2. App. is described, and a method which comprises disposing a body of molten metal around a longitudinally moving insulated conductor, circulating a confined cooling medium in heat-exchange relationship therewith in the zone intermediate the conductor and the surrounding molten metal, allowing part of the metal to solidify and thus form a tube-like body of greater diam. than the insulated conductor to be covered, feeding the body longitudinally and subjecting it to forces which materially reduce its diam.

Use of a vacuum in the adhesive application of labels of cellophane, etc., to articles. Geo. W. Von Hofe (to New Jersey Machine Corp.). U. S. 2,184,824, Dec. 26. Various details of app. and operation.

α-Derivatives of higher carboxylic acids (wetting, emulsifying, cleaning, antispattering and ore flotation agents, etc.). Frank J. Cahn (to Emulsol Corp.). U. S. 2,185,541, Jan. 2. Compds. are formed and used consisting of carboxylic acids having at least 6 C atoms, their salts, esters and amides, where at least one H attached to the C atom adjacent to the carboxyl group is replaced by the radical $—OCOCH_2SO_3Y$, where Y is a cation. Details are given of the production of the α-sulfate ester Na salt of Na stearate, the glycerol ester of α-bromopyridinium stearic acid, and sulfoacetic acid esters of α-hydroxy coconut oil fatty acid K salts, and general mention is made of the production of various other compds. of like character and derivation.

Sulfonic derivatives (wetting agents and detergents, etc.). Morris B. Katzman (to Emulsol Corp.). U. S. 2,184,770, Dec. 26. Various examples are given of the production of compds. of the general formula $RO—(alk—NY)_m—CO—Z(X)_w$, where R is an org. radical contg. at least 4 C atoms, alk and Z are each from the class of hydrocarbon radicals or substitution products thereof, Y is H, alkyl, cycloalkyl, alkoxyl, aralkyl, aryl or alkylol. *m* and *w* are whole numbers, and X is a sulfonic radical, suitable for use as dispersing agents in compns. for different uses, and which may be obtained by treating an amino alkyl ester of an aliphatic acid contg. at least 4 C atoms with a lower mol. wt. sulfo carboxylic acid, ester or halide of such an acid.

Sulfonated aromatic ether alcohols. Herman A. Bruson and Clinton W. MacMullen (to Röhm & Haas Co.). U. S. 2,184,935, Dec. 26. A sulfonated ether alc. of the general formula ROXOH in which R is a sulfonated aromatic nucleus and X is an alkylene or polyalkylene ether radical having at least 2 C atoms in each alkylene group is prepd. by sulfonating a compd. of the general formula R'OXOH in which R' is an aromatic nucleus, such as α,α,γ,γ-tetramethylbutylphenoxyethanol, to introduce a sulfonic group into the aromatic nucleus and to form a sulfuric ester group, and subsequently heating the product in aq., acid soln. to hydrolyze the sulfuric ester group. Products thus derived may be used as *wetting, emulsifying, cleansing* or *textile finishing agents*.

Polyoxyalkyleneammonium compounds. Heinrich Ulrich (to I. G. Farbenind. A.-G.). U. S. 2,185,163, Dec. 26. Nitrogenous condensation products suitable for use as *assistants in the textile* and *other industries* are produced by causing an amine oxide of tertiary amines such as trimethylamine oxide to react at a temp. above 50° and in the presence of water with an alkylene oxide such as ethylene oxide.

Sulfonated terpenyl alkyl phenols. Robert Zink (to American Cyanamid & Chemical Corp.). U. S. 2,186,132, Jan. 9. *Wetting* and *emulsifying agents* are prepd. by condensing a terpene such as α- or β-pinene with an alkyl phenol contg. at least one alkyl group of 4–8 C atoms such as *p-tert*-amylphenol and sulfonating the resulting condensation product. Several examples with details are given.

Emulsions. Otto Kress and Charles E. Johnson (to Institute of Paper Chemistry). Can. 387,131, Feb. 27, 1940. Stable aq. wax emulsion is prepd. by adding molten paraffin with agitation to an amt. of protein such that the paraffin particles are surrounded by a protein film preventing agglomeration when the emulsion is broken by the addn. of acidic material. The dry emulsion contains at least about 18% protein and the ratio of protein to paraffin is at least about 1:4. Examples are described.

Water-soluble urea-formaldehyde-ethylene glycol condensation products. Theodore S. Hodgins and Almon G. Hovey (to Reichhold Chemicals, Inc.). U. S. 2,185,167, Dec. 26. A process of prepg. water-sol., water-white, heat-convertible resinous products comprises simultaneously refluxing 3 mols. of aq. CH_2O, 150 parts of H_2O, 1–2 mols of ethylene glycol, 1 mol. of urea, 5 parts of 26% NH_4OH at boiling temp. for a period of 30 min. under agitation and cooling, the resulting product being characterized by its stability in soln., the urea, ethylene glycol and CH_2O constituting the principal reacting ingredients. Cf. *C. A.* **33**, 9491[1].

Viscosity-lowering condensation products from higher fatty acids and their esters. Stroud Jordan. U. S. 2,185,592, Jan. 2. A product suitable *for use in foods* such as sugar-chocolate coating mixts. is prepd. by treating an oil, fat or wax, such as cacao butter or its fatty acids or beeswax with P_2O_5 with controlled heating starting at the temp. of boiling water, without any substantial formation of phosphoric acid esters. Various examples with details are given.

Coated dispersible thiocarbanilide. David W. Jayne, Jr. (to American Cyanamid Co.). U. S. 2,185,591, Jan. 2. A product readily dispersible in water and remaining dispersed in froth flotation operations comprises thiocarbanilide, the individual particles of which are coated with a film of a hydrophilic, readily rehydratable protective carbohydrate colloid, slop from the alc. fermentation of molasses, lignin sulfonate or saponin.

Artificial leather. I. A. Skorov and Z. Ya. Shchekin. Russ. 55,986, Oct. 31, 1939. Softeners, leather fiber and vulcanization agents are passed through cold rollers into rubber preliminarily treated with 2–3 parts of a soln. of spruce tar and naphthalene in an org. solvent. The mass is rolled into sheets, dried and worked in the usual manner.

Sulfonated detergent products, etc. Ernst A. Mauersberger (to Alframine Corp.). U. S. 2,185,817, Jan. 2. Detergent, foam-forming and oil-emulsion-breaking agents are produced by the reaction at elevated temps. of aliphatic aldehydes contg. 1–5 C atoms in the mol. with compds. having the general formula: $RCO(NHC_xH_{2x})_nOH$ in which R represents any alkyl or hydroxy-substituted alkyl chain of a fatty acid contg. at least 7 C atoms, *x* represents a number from 2 to 5 inclusive and *n* represents a number from 1 to 4 inclusive, and sulfonating the resulting product. Various examples with details are given.

Stable urea-chlorine compounds suitable for use in bleaching and sterilizing. Irving E. Muskat and Fred C. Trager (to Pittsburgh Plate Glass Co.). U. S. 2,185,864, Jan. 2. A compd. of high active Cl content is prepd. by evapg. a mixt. of urea and HCl to substantial dryness and chlorinating the resultant product.

Chlorinated ammeline, etc. Irving E. Muskat and Albert G. Chenicek (to Pittsburgh Plate Glass Co.). U. S. 2,184,886, Dec. 26. A product of high active Cl content suitable for use as a *bleaching* or *sterilizing agent* is produced by treating an amide or imide of cyanuric acid such as ammeline or ammelide with a chlorinating agent such as Cl, in aq. dispersion.

Chlorinated melamine, etc. Irving E. Muskat and Albert G. Chenicek (to Pittsburgh Plate Glass Co.).

U. S. 2,184,883, Dec. 26. A chlorinated melamine in which a substantial amt. of the contained Cl is present as active Cl is prepd. by chlorination in an aq. dispersion. It is suitable for use as a *bleaching* and *sterilizing agent* and, similarly, active-Cl-contg. derivs. of compds. such as dicyanodiamide derivs. may be obtained, which have like uses.

Bleaching surfaces such as those of wood without immersion. Wilfred B. Hill and Bertram P. Ridge (to Imperial Chemical Industries Ltd.). U. S. 2,185,632, Jan. 2. A surface to be bleached is treated with a bleaching agent which will gel to a paste-like consistency, consisting of a mixt. of Na silicate soln. of a strength between 80° and 120°Tw. and H_2O_2, the mol. ratio of SiO_2 to Na_2O in the Na silicate soln. being between 1.8:1 and 2.2:1 and the mixt. having a concn. of H_2O_2 between 30 volume and 100 volume strength.

Compositions for dispersing vapors. Clellan R. Pleasants. Brit. 509,047, July 10, 1939. A fog or H_2O-vapor dispelling material is made by applying a hygroscopic material to extremely finely divided amorphous carrier particles of carbonaceous material, which may be of colloidal size. The hygroscopic materials may be gaseous, liquid or solid. The application preferably takes place substantially at the instant of formation of the particles, e. g., by spraying liquid or solid hygroscopic material into the fumes produced by the combustion of carbonaceous fuel. The hygroscopic material in finely divided form may be mixed with coal dust and the mixt. heated in a closed receptacle. Cf. *C. A.* **32**, 9344[8]; **33**, 7157[1].

Apparatus suitable for coating sheet materials with adhesives, etc. Horace J. Paynter (to American Can Co.). U. S. 2,185,223, Jan. 2. A rotating coating roller is used with a scraping doctor including a relatively soft material such as brass serving as a base for harder material such as Cr.

Wax composition for coating the inner surface of tin-plated metal containers. Frederick H. MacLaren and Elmer W. Adams (to Standard Oil Co. of Ind.). U. S. 2,185,031, Dec. 26. "Halowax" 0.5% or more and a condensation product obtained by treating chlorinated paraffin wax with naphthalene in the presence of $AlCl_3$ 0.5% or more are used with 99% or less of a tough amorphous-like petroleum wax m. about 71–76° and obtained by pressing slack wax sepd. from a 50 S. A. E. motor oil distillate from crude oils of the Salt Creek type.

Zein solutions suitable for coating paper or other materials or as a printing-ink vehicle. Roy E. Coleman (to Zein Corp. of America). U. S. 2,185,110, Dec. 26. A substantially nonaq. liquid coating compn. comprises zein and a substantially anhyd. solvent for the zein having a proportion of polar to nonpolar radicals which lies within a range extending between the limits of the proportion of polar to nonpolar radicals of MeOH and the proportion of polar to nonpolar radicals of EtOH, the solvent and compn. contg. not in excess of 5% of added water, and the compn. being stable against sepn. of the zein at temps. of about 20° and being relatively nongelling. U. S. 2,185,111 relates to a soln. of like character contg. zein and a solvent mixt. such as may be formed of propylene glycol and diethylene glycol monoethyl ether. U. S. 2,185,112 gives as an example of solvent mixt. diacetone alc. and ethylene glycol. U. S. 2,185,113 gives as example propylene glycol and benzyl alc. U. S. 2,185,114 gives as example MeOH and benzene or toluene. U. S 2,185,115 gives as example EtOH and ethylene glycol. U. S. 2,185,116 gives as example iso-PrOH and ethylene glycol. U. S. 2,185,117 gives as example ethylene glycol monoethyl ether. U. S. 2,185,118 gives as example diethylene glycol mixed with ethylene glycol. U. S. 2,185,119 gives as example benzyl alc. U. S. 2,185,120 gives as example acetone-free diacetone alc. U. S. 2,185,121 relates to a heat-hardening liquid coating compn. comprising a soln. of a prolamin such as zein and a water-insol. urea-aldehyde resin dispersed uniformly therein, in a solvent such as 95% alc. U. S. 2,185,122 relates to otherwise generally similar compns. contg. a partially reacted resinous polyhydric alc.-org. acid resin ester such as one formed from glycerol and phthalic anhydride instead of the urea-aldehyde resin. U. S. 2,185,123–4 relate to solns. of zein in 95% alc. in specified proportions. U. S. 2,185,125–6 relate to coating printed surfaces or paper, etc., with zein varnishes.

Decorative plates, slabs or panels. Cristallex Soc. anon. Brit. 508,791, July 3, 1939. A plate, etc., constituted by a decorative support of wood, cork, asbestos fiber cement, slate or marble is coated by application thereto of polyvinyl chloroacetate, which is used without the addn. of solvents and in powd. form, adhesion being obtained directly by heat and pressure. The plates, etc., may be used in facing walls or in the manuf. of furniture.

Sulfonamide derivatives. I. G. Farbenindustrie A.-G. Brit. 508,801, July 5, 1939. Condensation products having capillary activity are made by causing a sulfonic acid amide of formula RSO_2NHR', where R is an aliphatic, aliphatic-cycloaliphatic or aliphatic-aromatic radical contg. at least 12 C atoms, which may contain substituents and (or) may contain an O, S or N atom as a hetero atom in an aliphatic chain or as a bridge directly linking an aliphatic portion of the radical to a cycloaliphatic or aromatic nucleus, and R′ is H, Me, Et or $—CH_2CH_2NHSO_2R$, R being as above, to react at ordinary or raised temp. with CH_2O or a polymer thereof and an acid, an acid anhydride or an acid salt of a polybasic acid in the presence of a tertiary base or thiourea (I) or an alkyl deriv. of I capable of reacting in the iso-form. In a modification, a methylol compd. obtained by reaction of CH_2O or a polymer thereof with the sulfonic acid amide is caused to react with an acid, acid anhydride or acid salt of a polybasic acid in the presence of the tertiary base or I or alkyl deriv. of I capable of reacting in the iso-form; this modification may be further modified by causing the methylol compd. to react with a salt of the tertiary base or I or alkyl deriv. of I capable of reacting in the iso-form. In another modification, a *N*-halomethyl compd. of the sulfonic acid amide is caused to react with the tertiary base, I or alkyl deriv. of I capable of reacting in the iso-form. The reaction may be conducted in the presence of a solvent, e. g., H_2O, C_6H_6, toluene, PhCl, methylene chloride, ethylene chloride, CCl_4. The products are generally solid to semisolid, wax-like or lard-like, H_2O-sol. and easily dispersible in H_2O. They may be used for the *treatment of textiles, paper, leather, plastic masses*, etc. Among examples, (1) octadecanesulfonamide is heated at 90–95° for 8 hrs. with CH_2O and pyridine-HCl in pyridine (II) as solvent and the II is removed by evapn. to obtain a lard-like H_2O-sol. product of probable formula $C_{18}H_{37}SO_2NHCH_2(C_5H_5N)Cl$, an aq. soln. of which gives an insol. product on being heated or on addn. of aq. Na_2CO_3, (2) dodecane-*N*-chloromethylsulfonamide is dissolved in methylene chloride and I is added while cooling; on evapn. a lard-like mass is obtained and (3) *p*-isododecylcyclohexanol is condensed with Na chloroethanesulfonate by the Schotten-Baumann method, the corresponding sulfonyl chloride is obtained by reaction with PCl_5 and the compd., *p*-iso-$C_{12}H_{23}C_6H_{10}O$-$CH_2CH_2SO_2NH_2$ that is produced by subsequent treatment with NH_3 is heated with I, $(CH_2O)_x$ and dichloroacetic acid for 4 hrs. at 80–5°, a salve-like product being obtained on evapn. of excess I.

Refrigerant mixtures. David Crampton. U. S. 2,185,332, Jan. 2. A dehydrating and acid-neutralizing reagent for volatile refrigerants of the type in which water is difficultly sol., such as dichlorodifluoromethane, comprises a soln. of a metallic alcoholate such as NaOEt in a mixt. of MeOH to increase the soly. of water in the refrigerant and BuOH, cyclohexanol or 2-ethoxyethanol, to aid the soln. of the alcoholate in the lubricating oil used in the refrigerating system.

Use of methyl chloride in refrigerating systems. Frederick L. Koethen (to E. I. du Pont de Nemours & Co.). U. S. 2,186,028, Jan. 9. For inhibiting objectionable Cu plating in a refrigerating system in which MeCl is condensed and then evapd., the compression is effected in the presence of a mineral oil contg. triphenylguanidine.

Packaging material. A. A. Slesarev. Russ. 52,162, Nov. 30, 1937. The inner surface of the wooden packag-

ing material is covered with a 3–4% soln. of ammonium alginate and this is converted into the insol. Ca salt by treatment with a 20% soln. of $CaCl_2$.

Preparing chemical-treated pads such as those used in hair waving. Enno L. Long. U. S. 2,184,959, Dec. 26. Various details of app. and operation.

Colored flame candle. Wm. M. Fredericks. U. S. 2,184,666, Dec. 26. A candle with a wick is provided with metallic salts such as $SrCl_2$, etc., extending spirally about the wick, a coating of wax to seal the untreated portion of the wick and a combustible candle material about the wick and metallic salts.

Making beveled gaskets of asbestos, etc. Geo. T. Balfe (to Detroit Gasket & Mfg. Co.). U. S. 2,185,908, Jan. 2. Various mfg. details.

Flexible smooth-surface rugs. Frank M. Allen (to Congoleum-Nairn Inc.). U. S. 2,184,970, Dec. 26. A unitary sheet of fibrous material such as felt is impregnated with a waterproofing material such as an asphaltic compn. or synthetic resin compn., and an elongated tear-resistant element, such as a wire of stainless steel, is completely embedded in and approx. coextensive with an elongated recess penetrating a substantial distance laterally into the sheet adjacent one of its edges (various mfg. and structural details being described). U. S. 2,184,971 relates to details of rugs with a surface layer contg. a filler together with drying oils, cellulose esters or synthetic resins, etc.

Decalcomania. Ferdinand W. Humphner (to Mid-States Gummed Paper Co.). U. S. 2,185,983, Jan. 2. There are used together a plurality of paper sheets, colored adhesive between the sheets, adhesive over one of the sheets, a transfer body over the last-mentioned adhesive and an imprint on the body, the colored adhesive being water-sol. and tending to color the paper sheets when water is brought into contact with them. Cf. *C. A.* **34**, 2501[2].

Noncorrosive antifreeze liquids suitable for engine cooling systems. Fred R. Whaley (to Carbide and Carbon Chemicals Corp.). U. S. 2,185,238, Jan. 2. An alc. is used with about 1% or less of ethyl nitrate, isoamyl nitrate, nitromethane or nitroethane which serve as corrosion preventives. Cf. *C. A.* **34**, 200[3].

Laminated sheet material suitable for containers for tobacco products, etc. John W. Rash (to E. I. duPont de Nemours & Co.). U. S. 2,186,124, Jan. 9. A thin film of a nitrocellulose ink is applied to a smooth transparent base material such as regenerated cellulose and a film is also applied contg. polymerized isobutylene and rosin, with subsequent application of a layer of filled, uncured rubber compn.

Oil and grease containers, etc., of coated sheet materials. Ogden Johnson (to American Sealcone Corp.). U. S. 2,186,073, Jan. 9. Various mfg. details.

Material for brake blocks or linings. Harry B. Denman (to Detroit Gasket & Mfg. Co.). U. S. 2,185,333, Jan. 2. A method of making a brake block or lining comprises mixing together asbestos fibers and comminuted cork, wetting the surfaces of the cork and fibers with a wetting agent which is a solvent for a synthetic resin, incorporating in the mixt. a partially reacted synthetic resin in granular state sol. in the wetting agent and subjecting the mixt. to heat and pressure.

Polarizing structure suitable for automobile windshields. Hans Sauer (to Zeiss Ikon A.-G.). U. S. 2,185,018, Dec. 26. A base of transparent material has a foil of transparent material over the entire area of one of its surfaces, a portion of the foil located within the outline of the surface being adapted to polarize light passing through it, the polarizing portion of the foil merging with decreasing polarizing effect into the surrounding nonpolarizing area of the foil.

Tracing sheet. Robert F. Scott (to Carbide and Carbon Chemicals Ltd.). Can. 387,116, Feb. 27, 1940. A tracing sheet having at least one surface roughened so as to receive and retain pencil and ink impressions is composed of a transparent vinyl resin film prepd. by the conjoint polymerization of vinyl chloride with vinyl acetate, the proportion of vinyl chloride being 70–95% by wt.

Sound films. Jacques O. van Leer. U. S. 2,186,157, Jan. 9. A method of optical sound registration whereby the blackening is detd. by the light falling upon it, comprises throwing a spectrum on a film through a slit while the spectrum is moved in accordance with the sound being recorded whereby the wave length of the light varies in accordance with the sound being recorded whereas the film has a sensibility which is a function of the wave length.

Gas containers such as those of balloons. Harlan L. Trumbull (to B. F. Goodrich Co.). U. S. 2,186,183, Jan. 9. At least part of a gas-container wall comprises a film of plasticized γ-polyvinyl chloride compn.

Wicking containing glass filaments. Errol B. Shand (to Owens-Corning Fiberglas Corp.). U. S. 2,184,899, Dec. 26. Wicking suitable for use in lamps or stoves comprises glass filaments coated with an org. material such as a phenolic resin and woven into a textile fabric.

Projection screens, etc., comprising cellulose ester material such as cellulose acetate. Fred W. Jackman (to Warner Bros. Pictures, Inc.). U. S. 2,184,672, Dec. 26. A method of making a translucent projection screen involves spraying on a matrix such as glass or Al a plurality of initial coats of cellulose ester material such as cellulose acetate soln. to form a part of the body portion of the screen, allowing each of the coats to dry, applying a border strip of fabric on such partial body portion at its edge, spraying a second plurality of coats of the cellulose ester material over the partial body portion and border strip to build up the screen to the desired thickness and integrally to unite the strip with the body of the screen, allowing each of such last mentioned coats to dry and stripping the sheet from the matrix.

Thiocyanoalkyl ethers of alkylphenols. Gerald H. Coleman and Clarence L. Moyle (to Dow Chemical Co.). U. S. 2,185,183, Jan. 2. By treating a haloalkyl ether of an alkylphenol with an alkali metal thiocyanate (suitably in abs. alc. and with refluxing), *insecticidal compds.* are obtained (suitable for use in kerosene or the like as a solvent), such as: β-thiocyanoethyl ethers of 4-*tert*-butylphenol, $b_{2.5}$ 158–163°; of carvacrol, b_{10} 189–196°; of hardwood tar phenols, $b_{15.5}$ 190–5°; of mixed xylenols, b_{10} 175–190°; of thymol, b_5 173–6°; of 2-methyl-4-*tert*-butylphenol, b_{10} 195–8°; of 2-methyl-4-cyclohexylphenol, $b_{5.5}$ 210–220°; and γ-thiocyanopropyl ether of 2,4-di-*tert*-butylphenol, b_2 173–5°; thiocyanoalkyl ethers of such phenols, as 2-ethylphenol, 3-isopropylphenol, 4-*sec*-butylphenol, 4 - hexylphenol, 3,5 - dimethylphenol, 2,4,6-trimethylphenol, 2 - methyl - 4,6, - diisopropylphenol, 4 - *tert* - octylphenol, 2 - cyclohexyl - 4 - *tert* - butylphenol, 3 - cyclohexyl - 4 - methylphenol and the like. The ether compds. which may be so prepd. include β-thiocyanoethyl ethers, β-thiocyanopropyl ethers, γ-thiocyanopropyl ethers, γ-thiocyanoisobutyl ethers, thiocyanopentyl ethers and the like.

Thiocyanoalkyl ethers of alkylhalophenols. Gerald H. Coleman and Clarence L. Moyle (to Dow Chemical Co.). U. S. 2,185,184, Jan. 2. By treating a haloalkyl ether of an alkylhalophenol with an alkali metal thiocyanate (suitably in abs. alc. and with refluxing), *insecticidal compds.* (suitable for use in a solvent such as kerosene, *for killing house flies*, etc.), are obtained, such as: β-thiocyanoethyl ether of 2 - bromo - 4 - ethylphenol, b_3 170–1°; γ-thiocyanoisobutyl ether of 2-chloro-4-*tert*-butyl phenol, b_3 184–5°; β-thiocyanoethyl ether of 2-chloro - 4 - *tert*-butylphenol, b_{20} 230–5°; β-thiocyanoethyl ethers of 5-bromocarvacrol, b_5 203–8°; and thiocyanoalkyl ethers of such phenols as trichloro - *m* - cresol, 2,6-dichloro - 4 - ethylphenol, 4 - chloro - 2,5 - dimethylphenol, 2 - chloro - 4 - amylphenol, 2 - chloro - 4 - *tert*-butyl - 6 - methylphenol, 2 - chloro - 4 - *tert* - octylphenol, 4 - bromo - *o* - cresol, 2,4 - dimethyl - 6 - bromophenol, 2,6 - dibromo - 4 - *tert*-butylphenol, 2,4 - dichloro - 6-bromo - *m* - cresol, iodocresol, 2,4 - dibromothymol and the like. The ether compds. which may be so prepd.

include β-thiocyanoethyl ethers, β-thiocyanopropyl ethers, γ - thiocyanopropyl ethers, γ-thiocyanoisobutyl ethers, thiocyanopentyl ethers and the like.

Thiocyanoalkyl ethers of halophenols. Gerald H. Coleman (to Dow Chemical Co.). U. S. 2,185,185, Jan. 2. By treating a haloalkyl ether of a halophenol with an alkali metal thiocyanate (suitably in abs. alc. and with refluxing), *insecticidal compds.* are produced such as: γ-thiocyanopropyl ether of 2,4,6-trichlorophenol, b_4 195–6°; β - thiocyanoethyl ether of 2,4,6 - trichlorophenol, b_3 185–6°; β-thiocyanoethyl ether of 4-chlorophenol, b_3 153–5°; β-thiocyanoethyl ether of 4-bromophenol, b_3 181–2°; and thiocyanoalkyl ethers such as β-thiocyanoethyl ether of pentachlorophenol, β-thiocyanoethyl ether of 2,4,6 - tribromophenol, β - thiocyanoethyl ether of 2,4,5 - trichlorophenol, β - thiocyanoethyl ether of 2,4,5 - trichloro - 6 - bromophenol, β - thiocyanopropyl ether of 2,4,6 - trichlorophenol, β - thiocyanopropyl ether of 2,4-dichlorophenol, γ-thiocyanopropyl ether of 2 - bromo - 4 - chlorophenol, γ - thiocyanopropyl ether of 3 - chlorophenol, γ - thiocyanoisobutyl ether of 2,4,6-trichlorophenol, thiocyanopentyl ether of 4-chlorophenol, β-thiocyanoethyl ether of 4-iodophenol and the like.

Thiocyanoalkyl ethers of cyclohexylphenols. John E. Livak (to Dow Chemical Co.). U. S. 2,185,207, Jan. 2. By treating a haloalkyl ether of a cyclohexylphenol with an alkali metal thiocyanate (suitably in abs. alc. and with refluxing for several hrs.), *insecticidal compds.* are produced such as: β-thiocyanoethyl ether of 2-cyclohexylphenol, b_3 174–8°; γ-thiocyanopropyl ether of 2-cyclohexylphenol, b_3 215–18°; β-thiocyanoethyl ethers of *p*-cyclohexylphenol and of *m*-cyclohexylphenol, β-thiocyanopropol ether of *o* - cyclohexylphenol, γ - thiocyanopropyl ether of *p*-cyclohexylphenol, γ-thiocyanoisobutyl ether of δ-cyclohexylphenol, thiocyanopentyl ether of *o*-cyclohexylphenol, etc.

Thiocyanoalkyl ethers of phenylphenols. John E. Livak, Gerald H. Coleman and Clarence L. Moyle (to Dow Chemical Co.). U. S. 2,185,208, Jan. 2. By treating a haloalkyl ether of a phenylphenol or a nuclear substituted deriv. with an alkali metal thiocyanate (suitably in abs. alc. and with prolonged refluxing), *insecticidal compds.* are produced such as γ-thiocyanopropyl ether of 2-phenylphenol, b_3 198–200°; β-thiocyanoethyl ether of 3 - phenylphenol, b_2 207–12°; β - thiocyanoethyl ether of 2 - phenyl - 4 - chlorophenol, b_6 218–221°; β - thiocyanoethyl ether of 2-phenyl-4-*tert*-butylphenol, $b_{1.2}$ 225–230°; β - thiocyanoethyl ether of 2 - phenylphenol, b_3 182–6°; γ - thiocyanopropyl ether of 3 - phenylphenol, b_5 243–6°; β - thiocyanoethyl ether of 4-phenylphenol, m. 100–102°; and reaction products similarly derived from the β-chloroethyl ether of 2-phenylphenol; β - chloroethyl ether of 3-chlorophenylphenol, b_5 179–181°; β - chloroethyl ether of 4 - phenylphenol, b_3 163–5°; γ - chloroisobutyl ether of 2-phenylphenol, b_5 170–3°; β - chloroethyl ether of 2-phenyl - 4 - chlorophenol, b_3 149–150°; β - chloroethyl ether of 2 - phenyl - 4 - isopropylphenol, b_2 150–3°; β - chloroethyl ether of 2 - bromo - 4 - phenylphenol; β - bromoethyl ether of 2 - methyl - 4 - phenylphenol; β-chloropropyl ether of 2-phenylphenol; chloropentyl ether of 3-phenylphenol, etc.

Fire-resisting compositions. British Insulated Cables Ltd., Francis J. Brislee and Laurence Macfarlane. Brit. 509,069, July 11, 1939. Addn. to 498,181 (*C. A.* **33**, 4356[3]). The compns., suitable *for coating* or *impregnating textile materials*, etc., contain white lead 50–73, boiled linseed oil 3.5–11, chlorinated rubber 3–10 and chlorinated paraffin wax 2–10 or, in place of the last, chlorinated Ph_2 3–13 parts with a solvent for the chlorinated rubber according to the consistency desired; 12–37 parts of whiting may be added. The whiting may be replaced in part by approx. the same wt. of red ocher or French chalk, the remaining whiting being not less than 10% of the compn., the wt. of solvent being ignored in the calcn.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Hydrology of cretaceous subsoil of environs of Antwerp. F. Halet. *Bull. soc. belge géol., paléontol. hydrol.* **49**, 51–5 (1940).—A boring 375 m. deep at Hemixem, south of Antwerp, met chalk with flint at 327 m., but failed to yield potable or industrially useful water, a sample contg. 7 g. NaCl per l. with 0.139 g. CaO, 0.111 MgO and 0.028 SO_3. C. A. Silberrad

A biological survey of the Lower Hudson watershed. V. Chemical investigation of the Lower Hudson area. H. M. Faigenbaum. *N. Y. State Conservation Dept., Biol. Survey* (1936) No. 11, 146–216(1937)(Suppl. to 26th Ann. Rept.).—Pollution studies, involving detns. of free CO_2, dissolved O_2, alky. and H-ion concn., as well as measurements of temp. and depth, were made on the Hudson River, 7 major and 17 minor tributaries, the Bronx River and 3 New Jersey tributaries. Analyses were also made of 110 lakes and ponds and hatchery field station waters, in use or proposed. The effects of the principal types of pollution are discussed, including those resulting from sewage, milk and milk products, laundry wastes, bleaching, finishing and dyeing wastes, paper and assocd. wastes and miscellaneous wastes. **VIII. A limnological study of some lakes in the Lower Hudson area.** Willis L. Tressler and Ruby Bere. *Ibid.* 249–63.—$CuSO_4$ treatment of reservoir waters was very effective against the blue-green algae, but appeared to have a marked stimulating effect on copepoda, Cladocera and Rotifera. K. D. Jacob

Preliminary researches on the action of water on copper pipes. L. Tronstad and R. Veimo. *J. Inst. Metals* **66**, No. 860, 17–32(1940).—Addn. of Na_2CO_3, $NaHCO_3$ or CO_2 increases the soly. of Cu in still tap water in a closed system. This increase is probably due to a complex ion formation. The amt. of Cu in soln. increases until most of the O is used up and then decreases toward a limiting value. Equil. conditions are obtained in 3–15 hrs. The Cu content is a min. when the pH is 8.5. The amt. of Cu in soln. increases with temp. James W. Poynter

Ish River mineral springs. Z. N. Blyumshtein. *Uchenye Zapiski Kazan Gosudarst. Univ.* **98**, No. 2, 5–203 (1938).—An exhaustive description is given of the history, geology and hydrogeology of a no. of springs on the left bank of the Ish River, near its confluence with the Kama River. Numerous analyses of the waters (for solid and gaseous solutes) are given, and cond. and radioactivity data are recorded. B. C. P. A.

A rapid method of checking the accuracy of reported water analyses. V. P. Sokoloff. *Soil Sci.* **49**, 57–61 (1940).—The ratio of the sum of the cations or anions in water to the sp. elec. conductance at 25° ordinarily falls between 0.085 and 0.122. The variations between these limits are affected by (*a*) the ratio of Na to total cations, (*b*) the ratio of chloride to total anions and (*c*) the total concn. of electrolytes. After the conductance of a water and its Na and chloride content are detd., the total electrolyte content of the water and the sum of Ca plus Mg expressed as milliequiv. can be calcd. with considerable accuracy by means of the factors presented. The method described is not a substitute for complete analysis but rather a means of detecting errors made either in the course of such analyses or in calcg. and recording the results. Where a rough est. of Ca plus Mg is all that is needed, the method is satisfactory, provided important amts. of bases other than Ca, Mg and Na are absent. J. R. Adams

The development of water examination in the management of water supplies. C. H. H. Harold. *Water & Water Eng.* **40**, No. 500, 50–60(1938).—A discussion of the various chem. and biol. tests carried out in the treatment of water supplies. W. A. Moore

Standard methods for the examination of water and sewage. John F. Norton, *et al.* *Am. Pub. Health Assoc. Year Book* **10**, 110–11(1939–40).—Progress report. J. A. Kennedy

Determination of aluminum in filtered Neva River water according to the method of Hatfield. A. I. Ettinger. *Vodosnabzhenie Sanit. Tekh.* **1939**, No. 2, 68–71; *Khim. Referat. Zhur.* **2**, No. 5, 96(1939).—Hatfield's method (cf. *C. A.* **18**, 2213) permits rapid detn. of the dissolved Al and the highly dispersed $Al(OH)_3$. Since $Al(OH)_3$ cannot be detd. when in the form of a gel, the highly dispersed samples of $Al(OH)_3$ must be kept on ice to prevent their transformation into the gel state. W. R. H.

A study of procedures for detection of coliform organisms in Minnesota drinking water. Dean M. Taylor. *J. Am. Water Works Assoc.* **32**, 98–104(1940).—The *Standard Methods* "completed test" and 2 selective liquid media, using brilliant green lactose bile, and fuchsin lactose broth were compared. Brilliant green lactose bile was considered better than the fuchsin lactose broth, and compared so favorably with the "completed test" that it might replace it with advantage. D. K. French

Automatic apparatus for taking and bacteriologically inoculating samples of water. Raúl Ferramola. *Bol. obras sanit. nacion* (Buenos Aires) **3**, 391-5(1939); cf. *C. A.* **33**, 7449[6,6].—The app (described) consists of a chamber enclosing a rack holding 48 tubes contg. nutrient soln.; the rack is slowly propelled by clockwork past a pipet which at hourly intervals discharges into a tube 10 ml. of water from the main. The filled tubes are collected at suitable intervals and incubated as usual O. W. W.

Determination of boric acid in mineral waters. Michael L. Perteses. *Chim. Chronika* (Greece) **1938**, No. 10–12, 227–32(in Greek).—Pptn. of alk. earths from water with Na_2CO_3 carries down the H_3BO_3 (I) and this increases with the concn. From analyses of salt wells it is shown that a diln. up to a hardness of 200 German units is necessary, besides a double pptn. of the alk. salts. In the treatment of these salts with EtOH, where they have been sepd. as a moist saline mass, it is not possible to ext. the whole amt. of I. In order to avoid loss in distn. its vol. must be doubled with distd. water. When the amt. of alk. salts in the distg. flask reaches a max. it does not suffice to add only 2–3 cc. of water for 4 distns. with MeOH, but they must again be dissolved in water in order that after subsequent distn. of the aq. soln. the whole amt. can be recovered by double distn. from MeOH. For detn. of I the volumetric method is to be preferred. Lucien Y. Dyrenforth

Systematic investigation of waters for bromine. Ernesto E. J. Bachmann and Francisco C. T. Pertini. *Bol. obras sanit. nacion* (Buenos Aires) **3**, 396–402(1939).—Ten ml. of the concd. water is mixed in a wash bottle with a H_2SO_4 soln. of CrO_3; a slow current of air is aspirated through the liquid and through a disk of filter paper (S. & S. thick paper for spot tests) impregnated with a 0.2% soln. of fluorescein; about 10 min. is required to sweep out the liberated Br. The paper disk is then exposed to fumes of NH_3 to develop the color of the NH_4 salt of eosin which is compared with a previously prepd. scale. Iodine and nitrate do not interfere, nor does Cl in amts. not exceeding 100 mg./l.; in that case the Br is first absorbed in a soln. of 1% Na_2SO_3 + 0.2% Na_2CO_3 which is concd. and treated as above. No Br was found in the water of the Plata, Uruguay or other large streams; some well waters contained up to 0.8 mg./l. O. W. Willcox

Simplification of Powers' method for the determination of carbon dioxide in natural waters and comparison with the titration method. C. A. Peters, Sidney Williams and Paul C. Mitchell. *Ecology* **21**, 107–9(1940).—The method of Powers (cf. *C. A.* **21**, 3242; **22**, 3473) for detg. CO_2 in natural waters consists in finding the pH of the water as it naturally exists, and in addn., finding it at 2 specific CO_2 levels. From these data, with ionization consts., the air-CO_2 ratios and the CO_2 content are calcd. This paper introduces temp. corrections and shortens the calcns. by means of tables. For calcg. purposes the CO_2 content of the atm. is assumed to be 0.031%. The method checks well with the standard titration procedure with phenolphthalein as the indicator. C. R. Fellers

The Reddick nomogram for calculating the free carbon dioxide of waters, its application to natural, settled and final waters of the Palermo Establishment. Daniel J. Bengolea. *Bol. obras sanit. nacion* (Buenos Aires) **3**, 262–6(1939).—Application of the Reddick nomogram to the low-salinity Rio de la Plata River water for detg. the 3 variables alky., pH and free CO_2 results in discrepancies in the CO_2 figures unless the pH is detd. potentiometrically (glass electrode) instead of colorimetrically. Detn. of the alky. also introduces a slight discrepancy unless the methyl orange end point is controlled by a pH = 4 buffer soln. to which the same amt. of indicator has been added. CO_2 is best detd. on a sample of 250 ml. to which the phenolphthalein indicator has been measured from a pipet instead of by drops. O. W. Willcox

Determination of the pH of water. F. R. McCrumb. *Water Works & Sewerage* **86**, 403–6(1939).—A general discussion. W. A. Moore

Determination of iodide in mineral waters containing bromide and chloride. Ernst Müller and Walter Stump. *Z. anal. Chem.* **118**, 90–3(1939).—When small quantities of I^- in mineral waters are detd. by measuring the color produced in a solvent immiscible with water, after treatment with KNO_2 + HCl, the results are usually low because some of the I^- is oxidized to IO_3^-. The presence of considerable Cl^- or Br^- seems to catalyze this oxidation to HIO_3. If, however, the quantities of KNO_2 and HCl used are restricted, the oxidation to HIO_3 is avoided, although the slight excess of oxidizer or acid may cause incomplete oxidation of I^- to I_2. It is proposed, therefore, to carry out a rough detn. of the I^- in a preliminary expt. and then prep. a soln. contg. approx. the same quantities and det. the I^- content of this soln. with the quantities of KNO_2 and HCl in very slight excess. From this analysis with a known quantity of I^- an empirical factor can be obtained to be used in the analysis. W. T. H.

The continuous stability indicator. A simple device which provides the marble test and Langelier corrosivity index continuously. Linn H. Enslow. *Water Works & Sewerage* **86**, 107–8(1939).—The raw water flows continuously through a glass tube filled with chalk and then through a twin tube filled with marble or limestone chips. The pH and total alky. are detd. on the raw water and the effluent. W. A. Moore

Recent developments in water purification. Lewis V. Carpenter. *Proc. 12th Ann. Conf. Water Purif., in West Va. Univ., Eng. Expt. Sta., Tech. Bull.* No. **11**, 39–45(1938). G. G.

Recent developments in the purification of streams in the United States. Legislative measures and other questions of general interest. R. E. Tarbett. *Bull. office intern. hyg. pub.* **30**, 603–10(1938). R. Berggren

Programs for training of water-works operators. A. F. Dappert, *et al.* *Am. Pub. Health Assoc. Year Book* **10**, 67–74 (1939–40). J. A. Kennedy

British water-works practice. John Bowman. *Water & Water Eng.* **41**, 595–9(1939); *J. New Engl. Water Works Assoc.* **53**, 385–411.—A comparison between water-works practice in the New England states and in Great Britain. W. A. Moore

Significant experiences in the treatment of water in New York state. C. R. Cox. *J. New Engl. Water Works Assoc.* **53**, 444–57(1939).—At Delhi, N. Y., in addn. to coagulation and filtration it was found necessary to sterilize, and because there was so much opposition to Cl, ozone was tried. Results were not entirely satisfactory. With enough ozone water was adequately disinfected, but control was very difficult. Cost of operation was excessive. At South Fallsburg, where heavy chlorination was followed by dechlorination, failure to get satisfactory results was due to improper coagulation and filter washing. At Elba a hard water was softened with zeolite. Unevenness of the supply interfered with consistent results, and the treated water was corrosive. D. K. French

Reforming Florida waters. A. P. Black. *Water Works Eng.* **92**, 726, 729–30, 733–4, 737(1939). W. A. M.

Operating results at Louisville (Ky.). Nathan N. Wolpert. *Water Works Eng.* **92**, 738, 741–2, 745(1939).—Approx. 33% of suspended solids is removed in the sedimentation basins, 65% by coagulation and 2.3% by the filter. The av. alum dosage is 0.86 gr./gal. Activated C, in amts. varying from 10 to 30 lb./million gal., is applied to the water leaving the coagulation basins. Filters are washed with a 2% caustic soln. to remove Mn. W. A. Moore 1

Studies at water works using a very impure source of water. M. Gundel and K. Stundl. *Z. Hyg. Infektionskrankh.* **120**, 633–9(1938).—H_2O from 2 works was examd., at both of which a very impure supply is treated first with $Al_2(SO_4)_3$ to ppt. suspended matter and remove a large proportion of the organisms, and then chlorinated. The treated H_2O was quite satisfactory for human consumption. B. C. P. A. 2

Soft water comes to the city of Clarksburg (W. Va.). Recent additions to purification plant involve zeolite softening. Scotland G. Highland. *Water Works & Sewerage* **86**, 123–6(1939). W. A. Moore

Effect of the mineral acid hardness of water on the lime-carbon dioxide equilibrium. Hans Wette. *Gas- u. Wasserfach* **83**, 37–9(1940).—The equil. value for free CO_2 increases and the equil. pH value falls for const. carbonate hardness with increase in the mineral acid hardness. The exact equil. CO_2 content cannot be calcd. by the use of Tillmans' tables or curves when the water contains natural or added mineral acid hardness. Only a slight difference prevails between the equil. pH values calcd. by Strohecker's (cf. *C. A.* **31**, 7568[8]) and Tillmans' methods (cf. *C. A.* **25**, 1310). The value for excess free CO_2 and const. carbonate hardness falls with increase of mineral acid hardness, but the pH is unchanged. R. W. Ryan 4

Improving the bacterial quality of water. John R. Bayliss. *Water Works & Sewerage* **86**, 96–8(1939).—It is recommended that for small plants at least ten 10-cc. tubes be inoculated daily and for large plants at least 40 such tubes be inoculated. If more than 10% of the 10-cc. tubes or all the 100-cc. tubes inoculated with finished water show gas formation either for 2 consecutive days or 3 days in one week corrective measures must be taken. The total no. of bacteria per cc. on agar at 37° should not average more than 2. It is also recommended that the water should carry a Cl residual of 0.5 p. p. m. 2 hrs. after its application. If considerable pollution is present, this value should be 1.0 p. p. m. W. A. Moore 5

Submerged combustion. L. H. Scott and F. C. Abbott. *Water Works & Sewerage* **86**, 381–5(1939).—Lime-softened water is recarbonated by submerged combustion of a mixt. of air and natural gas. The advantages of this process over the conventional method of recarbonation are: easier controllability, simplicity of equipment, greater chem. efficiency, elimination of corrosion trouble and elimination of scrubbing towers. W. A. M. 6

Methods of removing free carbon dioxide from natural waters. E. L. Streatfield. *J. Soc. Chem. Ind.* **58**, No. 10, 313–17(1939).—Both Na_2CO_3 and NaOH effectively removed the theoretical amt. of CO_2. When these 2 reagents were used, the pptn. of the $CaCO_3$ was very slow. Aeration by means of a fountain cascade with air diffusion was effective in reducing the CO_2 content from 45 to 10 p. p. m. With a given vertical drop, the amt. of CO_2 removed by aeration increases with the no. of trays used in the cascade and also with the quantity of air used. A 78% removal of CO_2 was obtained with a fountain cascade with air diffusion when 3 million gal. per day is treated. W. A. Moore 7

Acid waters and their correction. Éd. Imbeaux. *Rev. hyg. méd. prévent.* **61**, 585–6(1939–40); cf. *C. A.* **33**, 6491[3]. —Methods in use in various cities are outlined. The com. prepn., Neutralite, developed by the Degremont Co. of Cateau (Nord) is used most widely. This is a granular substance contg. Ca and Mg salts. C. R. Fellers 8

Studies in the use of sodium silicates. H. E. Lordley and Marsden C. Smith. *J. Am. Water Works Assoc.* **31**, 2149–56(1939).—Na silicate properly prepd., used and apportioned will almost always produce a better floc than alum alone, and a larger floc, which is better physically, and which settles more rapidly. It does not react well with iron salts, and at low temps. and turbidities iron salts are to be preferred to the alum with silicates. D. K. French 9

Coagulation studies on Rio de la Plata River water. F. Aurelio Mazza. *Bol. obras sanit. nacion* (Buenos Aires) **3**, 357–62(1939).—Further coagulation studies with Al sulfate were made to compare single injections with fractional injection wherein at first $^2/_3$ of the total amt. was used and followed by a period of agitation, addn. of the remaining $^1/_3$, and repeated agitation. Fractional injection now appears to offer no practical advantage; the previous contrary opinion was based on noncomparable expts. O. W. Willcox 10

A vacuum chlorinator. B. M. Romesnitskiĭ. *Vodosnabzhenie Sanit. Tekh.* **1939**, No. 1, 48–53; *Khim. Referat. Zhur.* **2**, No. 5, 95(1939).—A chlorinator (either stationary or portable) is described for disinfection of drinking water without the use of special indicator solns. A cylinder can be used for the supply of Cl. W. R. Henn 11

Experimental laboratory investigations of double chlorination of the Neva River water. S. V. Moiseev. *Vodosnabzhenie Sanit. Tekh.* **1939**, No. 2, 61–8; *Khim. Referat. Zhur.* **2**, No. 5, 95(1939).—Double chlorination lowers the cost of the technol. process of water purification. Addn. to water of not less than 0.7 mg./l. of Cl 2 min. after coagulation and before settling, and of not less than 0.1 mg./l. in the final chlorination was effective. The water should contain 0.2–0.3 mg./l. of residual Cl with a total Cl expenditure in the double chlorination of 1.5–1.6 mg./l. W. R. Henn 12

The role of ammonia in the treatment of water with chloramines. R. Buydens. *Rev. hyg. méd. prévent.* **61**, 576–84(1939–40).—This is a chem. study of the effect of the addn of NH_3 to water followed by Cl treatment. The efficacy of treatment increases as the pH decreases from 8.0 to 6.5. Both mono- and di-chloramines are formed in most waters. The chloramines are more stable in water contg. limited amts. of org. matter than was supposed. In fact the presence of org. matter did not materially delay bacterial destruction by the NH_3-Cl treatment of water. It is important that the Cl be thoroughly mixed with the water pretreated with NH_3. The NH_3-Cl reaction should be further studied by bacteriol. means. C. R. Fellers 13

Free ammonia in the presence of chloramine. E. E. Wolfe. *Water Works & Sewerage* **86**, 509–11(1939).—To 250 cc. of the water add 0.5 cc. of a 5% Na_2CO_3 soln. Transfer a portion to a 50-cc. Nessler tube and add a few g. of Folins Permutite to the remainder and shake the mixt. for 5 min. Filter the suspension through a cotton plug (rejecting the first filtrate) into another Nessler tube. Add 0.2 cc. of H_2SO_4 (1–10) to both tubes, then allow to stand for 1 min. Add Nessler's soln. (2 cc.) and compare the developed color with standards. The difference in readings between the 2 tubes is a measure of the amt. of free ammonia present. W. A. Moore 14

Chlorine vs. chloramine residuals. A method of differentiation between the two forms of available chlorine. A. E. Griffin. *Water Works & Sewerage* **86**, 275–6(1939); cf. *C. A.* **33**, 7006[9].—The total Cl is detd. in the usual manner (call *A*). A second sample is then divided and to one portion is added $NaNO_2$ soln. equiv. to 1.5 times the amt. of Cl as detd. in *A*. After 1 min. *o*-tolidine reagent (excess acid type) is added to each portion at the rate of 2.0 cc./100-cc. sample. The tubes are placed in the dark and after sufficient time for color development they are compared with standards. The Cl_2 as detd. on the untreated portion represents the total available Cl_2 while that detd. on the $NaNO_2$-treated portion approximates the amt. of chloramine present. The total Cl_2 − chloramine Cl_2 = oxidative Cl_2 or hypochlorite present. W. A. Moore 15

Method for the preparation of silver-plated sand no. 56. S. V. Moiseev. *Trudy Vtorogo Leningrad. Med. Inst.* **8**,

11-47(1937); *Chem. Zentr.* **1938, II,** 3424; cf. *C. A.* **29,** 1910⁹.—Sand having a diam. of 0.5–1 mm. is most suitable for silver-plating. The sand is heated at 600° and while still hot poured into cold water, dried and finally shaken in a 0.5-mm. sieve to remove particles smaller than 0.5 mm. Soln. *A* is prepd. by dissolving 20 g. $AgNO_3$ in 150–200 cc. distd. water, adding 2.5% NH_3 until the ppt. formed is almost dissolved, filtering and dilg. to 2 l. Soln. *B* is prepd. by adding 10 g. $AgNO_3$ and 8.3 g. Seignette salt to 5 l. boiling water, boiling 1 min., and storing in the dark. The sand is plated by adding 500 cc. of soln. *A* and 500 cc. of soln. *B* to 500 g. of sand. After silvering, the sand is washed with distd. water to remove the Cl. The amt. of pptd. Ag should amount to 0.28–0.32%. The olygodynamic action of the prepn. is good. W. A. M.

Development and use of the bone filter for removing fluorine from drinking water. H. V. Smith and W. B. Davey. *Ariz. Agr. Expt. Sta., Tech. Bull.* **81,** 249–92 (1939); cf. *C. A.* **30,** 7664⁶.—The Sanchis method (*C. A.* **28,** 2813⁴) for the detn. of F gives only approx. results. PO_4 ions cause low results and SO_4 ions cause high results. Bone is prepd. for use in removing F from drinking water by boiling with alkali until it has lost its flinty characteristics and has become snow white in appearance, washing out the excess alkali with H_2O, and neutralizing with dil. HCl. The bone can be regenerated after use by similar treatment. Calcination of the bone at 400–600° for 10 min., followed by 10-min. acid treatment, yields a better bone product for the F-removal process. Bone prepd. in this way will not putrefy as do some of the alkali-acid treated products. A bone fragment size of 40–60 mesh was most desirable. The period of contact directly affects the percentage removal of F. pH of the water had little effect unless it was too alk. The presence of salts other than fluorides had little effect on F removal. Double treatment of water with 2 portions of bone was no better than a single treatment with twice as much bone. The mechanism by which bone removes F from water appears to be through the formation of solid solns. rather than simple anion exchanges as was at first supposed. Other phosphates were tried in filters but none worked as well as bone. Bone is about twice as effective as the com. $Ca_3(PO_4)_2$. Defluorite. It is entirely practical to remove excess F from drinking water supplies by means of bone filters. 37 references. C. R. Fellers

The sewage-treatment plant of Lakewood, Ohio. Rollin F. MacDowell. *Water Works & Sewerage* **86,** 350–3 (1939).—The plant provides for preliminary treatment with sep. sludge digestion together with pre-chlorination and post-chlorination if necessary. W. A. Moore

Design of sedimentation tanks [for sewage]—detention periods and efficiency in removing suspended solids. L. B. Escritt. *Sewage Purif.* **1,** 151–6(1939).—A study of the theory of sedimentation of nonflocculating particles from the formulas of Stokes and Hagen leads to the conclusion that the surface area of the tank is of primary importance in design, whereas the capacity is of secondary importance. In practice the inlets, outlets, variability of rates of flow and strength of sewage, short-circuiting, etc., upset such theoretical considerations. Sedimentation tanks are designed on the probable max. flows [or on 3 times the dry-weather flow (d.-w. f.)] and at this rate of flow the upward flow should be not greater than 6 ft./hr. (i. e., it should have a surface area of 1 sq. ft./300 gallons/day of the d.-w. f.). Under standard conditions with a tank of good efficiency, when the max. rate of flow is 3 × d.-w. f. a satisfactory detention period should be 2 hrs., i. e., the tank capacity = 6 hr. d.-w. f. In the design of pyramidal, semiupward-flow tanks, capacity is important. The size of a tank of any particular detention period is limited by the max. length of advantageous weir and min. workable capacity. As a general rule, a

tank with 6 hr. d.-w. f. might be designed not to exceed 28 ft. square, with castellated weirs for smaller sizes. The period of desludging affects the capacity as the depth of sludge is considerable, owing to the low capacity of the apex of the pyramid. Thus a tank of 6 hr. d.-w. f. capacity will have $^2/_3$ of its depth of sludge after 4 days with sludge containing $97^1/_2\%$ of H_2O at $^1/_2$ gallon of sludge/head/day and 25 gallons of sewage/head/day, and therefore must be desludged at least twice per week. The inlet is important: it should extend not greater than $^1/_3$ of the depth down, should have no downward action liable to disturb settled sludge and should be of low velocity (not greater than $1^1/_3$ ft./sec. at max. flow). The efficiencies of tanks, mech. flocculation, etc., are compared. B. C. P. A.

Percolating filters and humus tanks: their design, construction, and operation. L. B. Escritt. *Sewage Purif.* **1**, 243–50(1939).—The grading of media has been reversed in recent work on rapid filtration, so that the surface material is coarser than the general mass of the bed, in order to prevent ponding. The capacity of the filter bed is ascertained from the dosing rate per cubic yard (Y), which for medium material = $(2250/x) + 2.5$, $6000/x$, and $(7750/x) + 21$, resp., for liquor after detritus tank, continuous settlement, or continuous pptn. treatment, where x = concn. of sewage by McGowan's formula. For economy the filter bed should be as deep as possible, but this means increased rates of surface discharge, resulting in ponding, especially if the surface material be fine. To avoid this the rate of flow per yard super is limited (e. g., 1 yard super per 133 gal. dry weather flow), from which the depth can be calcd. The types of filters, feed distribution, bed construction, humus tanks, operation, and maintenance are discussed. B. C. P. A.

The determination of hydrogen sulfide. Geo. Martin. *Water Works & Sewerage* **86**, 501(1939). An app. *for the detn. of H_2S in sewage, polluted water* or *sewage gas*. Air is drawn through the liquid which is contained in a suction flask for 2 min. The H_2S which is released from soln. is drawn up through Pb acetate paper. The amt. of H_2S is detd. by comparing the degree of darkening of the paper with standard papers. W. A. Moore

Dilution of crude sewage. Its importance in disposal methods. J. Finch. *Sewage Purif.* **1**, 197–202(1939).—Advantages of diln. by rain H_2O, especially to the activated-sludge process, are that a denser, better-settling sludge is obtained and increased purification results. This superiority is due to the dissolved O of the rain, and can be artificially reproduced by dilg. the incoming strong sewage with a portion of the final effluent. To effect this, thin surplus sludge in the activated-sludge process or thin humus sludge in the biofiltration plant may be returned to the sewage inlet, either continuously or periodically according to the vol. and concn. (i. e., the load) of the sewage. Continuous diln. is the better as it evens out irregularities of the sewage. B. C. P. A.

Copper and copper alloys in sewage treatment. Richard S. Burr. *Water Works & Sewerage* **86**, 362–4(1939). W. A. Moore

Rate of solution of air and rate of transfer for sewage treatment by activated-sludge processes. R. Hicks and G. E. P. Box. *Sewage Purif.* **1**, 271–8(1939).—Methods of detg. the rates of O absorption in sewage sludge mixts. are discussed. Tests on the relationship between the rates of O demand and dissolved-O concn. confirm Phelp's law over a wide range of values that the biochem. oxidation is independent of the O content of the sewage sludge mixt., except at less than a crit. point when the dissolved O concn. falls to less than 1 p. p. m. Rates of O absorption detd. by the Odeeometer (*C. A.* **30**, 2298[8]) were compared with those by the dissolved O depletion method. With the Odeeometer, the change of speed of the aeration paddle caused changes in concn. of dissolved O, so that until this has reached equil., the figures obtained for absorption rates will be misleading, owing to the sludges absorbing some O at the expense of the dissolved O instead of wholly from the air. At very low paddle speeds the max. rate of soln. of O from air was reached and the dissolved O falls to a crit. value below which the sludge was deprived of O. This crit. min. value lies between 0.5 and 1.0 p. p. m. of dissolved O. Tests confirm that the O-demand of activated sludge is the deficiency demand of the liquid with which it is in contact at any particular concn. of dissolved O. B. C. P. A.

Diffusers and diffuser plates in activated-sludge systems. J. W. Lewis. *Sewage Purif.* **1**, 174–7(1939).—High operation cost of diffused aeration due to general inefficiency of compressed-air systems is increased by the resistance of small pipes and diffusion plates, which increases by clogging with use. Plates of min. resistance compatible with efficient diffusion should be employed. A high permeability is essential as liability to clog, pressure loss, and power consumption are less with coarse pores. Permeabilities of 40–60, instead of 10–20, are now used, as the bubbles must reach a certain size to overcome the surface tension that holds them. Clean, dry, oil-free air is essential and is best provided by turbo-machinery after prefiltering the air. Clogging on the liquor side of the plate is liable during temporary stoppages of aeration (fine solids enter the pores) and by org. growths due to uneven diffusion. Plates can be cleaned *in situ* (after emptying the tanks) by high-rate air-blowing, followed by sand-blasting to remove the surface $^1/_{32}$ in.; 30% HCl treatment with stiff brushing, etc. Removable plates can be soaked in 30% HCl for 4 hrs. and washed, and if greasy they can be boiled in NaOH and washed, or stacked in a furnace with $^1/_2$-in. spaces between each plate, raised to 1000°, and slowly cooled (16 hrs.). Tubular-type diffusers are described and the materials used are discussed. B. C. P. A.

Sludge filtration. LeRoy W. Van Kleeck. *Water Works & Sewerage* **86**, 91–5, 135–9, 277–81, 310 13, 415–19 (1939); cf. *C. A.* **33**, 3041[9].—The following topics are discussed: construction of vacuum filters, elutriation of sludge, chemicals used in sludge conditioning together with the amts. used and methods of feeding, industrial waste in sludge, sludge conditioning, dry solid yields of vacuum filters, disposal of filtered sludge, bacteria in the filter cakes, and lab. control of sludge filtration. W. A. M.

Study of hydrolytic enzymes in activated sludge. Robert S. Ingols. *New Jersey Agr. Expt. Sta., Bull.* **669**, 3–32(1939); cf. *C. A.* **32**, 8052[8].—There is a marked increase in pepsin during the development of activated sludge from sewage. Lipase, diastase and trypsin increase slightly. Lipase, pepsin and diastase are found only on the surface of the sludge floc; trypsin is found also in the liquor surrounding the floc. The enzyme activities of a mixt. of the activated sludge and sewage change during the 6-hr. aeration period. Slight fluctuations had but little effect on the enzymes studied. When activated sludge is aerated continuously for several weeks, the importance of the enzymes is demonstrated, because the enzymes increase during the 1st 3 days and only after that decrease gradually. Diastatic activity can be increased by as much as 500% by adding starch to the sewage at 5°. The rate of hydrolysis is influenced by the rate of assimilation of its hydrolyzate by the sludge organisms. Diastase reacts better at a concn. of salts slightly higher than that found in the activated sludge liquors. Plasmolysis of the sludge organisms leads to an increase in the free enzymes. Clarification of the sewage is correlated with the biophys. properties of the activated sludge floc. Purification is correlated with the biochem. property, enzyme activity, of the sludge floc. 33 references. C. R. Fellers

Sludge disposal at Minneapolis, Buffalo and Chicago. F. W. Mohlman. *Sewage Works J.* **11**, 1089–90(1939).—Vacuum filtration and drying in incinerators at these 3 cities present 3 distinctively different problems in kinds of sludge handled, chem. treatments and amts. of water evapd. A valuable comparison of the data in the 3 annual reports is tabulated. W. D. Hatfield

Contamination of ground water by chemicals. Alexander Lang and Hayo Bruns. *Gas- u. Wasserfach* **83**, 6–9(1940).—The danger of ground-water contamination by sol. materials is pointed out and examples of contamination by picric acid residues, slag quenching water and coal wastes are given. The use of fluorescein is a valuable aid in detg. the source of chem. contamination. Hydrologists and hygienists need to coöperate in studying the effect of ground-water flow on contamination. R. W. Ryan

Raritan River pollution. II. Willem Rudolfs. *New Jersey Agr. Expt. Sta., Bull.* **659**, 22 pp. (1939); cf. *C. A.* **24**, 1918.—The natural waters of the Raritan River are fairly const. in chem. compn. and in bacteriol. content. Because of the softness and low mineral content the water is particularly suited for industrial uses. The increase in chem. pollution comes largely from the towns of Bound Brook and Somerville. The discharge of chem. wastes in the river interferes with self-purification and oxidation power of the stream, is detrimental to fish life, and prevents the fullest recreational use of the river. Bacteriol. results show that the river is unfit for swimming. Calcns. show that the sludge and other O_2-consuming substances removed by the treatment in sewage plants along the river are equiv. to 8750 lb. of O_2 or to the addn. of 90–120 million gals. of clean water daily. Completion of the sewage-treatment plants now under construction will reduce the content of intestinal bacteria in the summer months by about 99.9%. Until industrial pollution is removed, the general improvement of the river will be less than could be expected from the investment in sewage-treatment plants by various communities. C. R. Fellers

Trade effluents. IV. Influence on later stages of sewage purification. J. Hurley. *Sewage Purif.* **1**, 158–63 (1939); cf. *C. A.* **33**, 8871[1,5].—Certain trade wastes (e. g., phenols of gas liquors, cyanides of metal-plating liquors, etc.) are liable to cause sterilization of the biol. purification processes. Generally, if they both serve the same population, a sewage works can deal with the gas-works liquor of its own area if the flow is properly regulated and the tar and oil are sepd.; when, however, the discharge of gas liquor is 0.5% of the total sewage flow great care is necessary. In the main, trade wastes are warmer than is domestic sewage, and thus maintain temp. conditions favorable to biol. processes. Aerial nuisances by overdosing sewage-sick land and during dosing of percolating filters through the escape of odor (especially if badly designed) are usually increased by trade waste; some decomp. (e. g., tannery, fellmongery, milk-product wastes, etc.); some wastes (e. g., milk products, breweries, distilleries, etc.) containing sugar encourage organisms which decompose offensively. The trouble caused in biological processes by pulsations in strength and vol. of sewage through not being levelled out sufficiently in the sedimentation tanks is often not realized. Percolating filters give their best results with careful supervision but tolerate considerable ill-usage; they cannot, however, withstand sudden heavy flushes of trade wastes. Most trade wastes can be treated in admixt. with domestic sewage if the flow is regulated and any other necessary precautions (e. g., pretreatment at the factory, chem. pptn., etc.) are taken, depending on individual circumstances. Overloading is the chief cause of filter-clogging. Ponding results from deposition of mineral matters, excessive org. growths, fibrous matter, grease or fat, etc. Acidity or alkalinity of a trade waste is not likely to damage the filter media by disintegration as it is so dild. Although trade wastes increase the load on the filtration plant, most can be purified reasonably if the ratio to domestic sewage is not too high and suitable precautions have been taken. **V. Influence on the later stages of sewage purification.** J. Hurley. *Ibid.* 203–6(1939).—The activated-sludge process is more prone to complication due to trade waste than is the percolating filter, except for Fe liquors, which are beneficial to the activated-sludge process, tending to coagulate the floc, whereas it tends to clog percolating filters. The activated-sludge process is more sensitive than the percolating filters to variation in concn. of most trade wastes, but usually works satisfactorily if the flow is regulated, and tar and oils are removed from gas liquors. With the diffused-air type of activated-sludge process, clogging of the diffuser plates by trade wastes [e. g., $Fe(OH)_3$ from pickling liquor, grease from wool scouring, etc.] may be serious, especially if the air supply is interrupted. pH 6.5–8.0 gives good effluents with the activated-sludge process, but flocculation is aided by slight acidity and nitrification by slight alky. The corrosive effects of trade waste on cement, mortar, etc., are aggravated in the activated-sludge process by the rapid motion of the liquor. Bulking in presence of trade waste is usually due to under-aeration caused by the increased load. Rising of sludge in settling tanks is not confined to industrial sewage. **VI. Influence on disposal of sewage sludge.** *Ibid.* 251–5.—Trade wastes increase the sludge-forming solids for disposal. Some trade wastes (e. g., Fe liquors, etc.) encourage flocculation, causing denser sludges more readily dried on beds, and easier to filter-press. Others (e. g., soaps, greases, etc.) tend to convert the sludge into a gel state, hindering drying and filter-pressing. Trade wastes cause little trouble in digestion except influencing the gas yield and grease and fat tending to cause acidic conditions. Pumping of sludge, other mech. H_2O-removing processes, grease recovery from sludge at Bradford and Halifax, and the utilization as fertilizer are discussed. **VII. Treatment at the factory.** *Ibid.* 295–300.—The pretreatment of various trade effluents prior to their discharge to the sewers and the recovery of by-products from gas liquor, textile waste, grease, metal-pickling liquors, etc., are discussed. Only the min. treatment necessary to prevent damage to sewers and disposal works should be given. If the pH is adjusted, the corrosive action of the wastes from the viscose process of rayon manuf. can largely be prevented by removal of S compds. (particularly sulfides). Biol. filtration (particularly on enclosed aerated filters) can effectively oxidize sulfide liquors and appears to be a better method than pptn. B. C. P. A.

Limitations of Euglenidae as polluted water indicators. James B. Lackey and Russell S. Smith. *U. S. Pub. Health Repts.* **55**, 268–80(1940).—Sixteen references. J. A. Kennedy

The arsenic-containing waste waters from the production of Schweinfurth green and calcium arsenite. S. N. Cherkinskiĭ and F. I. Ginzburg. *Vodosnabzhenie Sanit. Tekh.* **1939**, No. 2, 99–106; *Khim. Referat. Zhur.* **2**, No. 5, 96(1939).—The waste waters from the production of Schweinfurth green are contaminated with the complex As-Cu compds. and As_2O_3, and the waste waters from the production of Ca arsenite are contaminated with As compds. and As_2O_3. These waters are rendered harmless by removal of the As compds. or by great diln. in reservoirs. W. R. Henn

Purifying action of pure cultures of protozoa on domestic waste water. G. Jäger. *Z. Hyg. Infektionskrankh.* **120**, 620–5(1938).—Viehl's observation, that flocculation of the colloids is accelerated by presence of protozoa, is confirmed. A pure culture of *Paramecium caudatum* is practically as effective as a mixed culture of *P. caudatum, Euplotes charon, Vorticella alba*, and small colorless flagellates. The effectiveness of the last 3 decreased in the order given. The differences in activity are due to differences in nutrient uptake and in sensitivity to impurities in the H_2O. B. C. P. A.

Albermarle's (N. C.) new combination waste-disposal plant. Geo. S. Moore. *Water Works & Sewerage* **86**, 143–5(1939).—Treatment consists of primary settling, chem. coagulation and septic sludge digestion. A reduction of approx. 90% in suspended solids and 80–95% in B. O. D. is obtained. W. A. Moore

Some aspects of combined garbage-sewage disposal.

K. C. Lauster. *N. Dakota Water & Sewage Works Conf., Official Bull.* 7, No. 11, 6–8(Aug., 1939); *U. S. Pub. Health Eng. Abstracts* 20, IHS, 2(Feb., 1940).—Assuming for domestic sewage, 350 p. p. m. suspended solids, 100 gal. per day daily flow with 60% removal of suspended solids, and for garbage, 0.55 lb. per capita per day, of which 0.14 lb. per capita per day are dry solids and that 41% of this will settle out, L. has calcd. that garbage discharged ahead of sedimentation devices requires an increase of 32% in digestion capacity and that garbage discharged directly into the digestion tanks requires a 9% increase. This theoretical calcn. gives results that are contradictory to statements that garbage addn. has little or no effect on digestion-tank requirements.

Treating waste water, etc. Kai Petersen. Brit. 508,881, July 7, 1939. Water contg. convertible or decomposable org. matter is purified according to the activated sludge method by subjection to an aerobic biol. treatment comprising addn. thereto of a part of already treated water, if desired after an addnl. aerobic biol. treatment, the 1st-mentioned aerobic biol. treatment being effected in a rotating or oscillating solid-walled container through which O-contg. gases are passed. The treatment may be promoted by means of freely movable distributing bodies, e. g., small stone chippings, slags, pieces of wood or cork, operating as culture-carrying bodies for the aerobic microorganisms, and thin constantly active films of microorganisms maintained thereon by the mutual movement of the same.

Sedimentation of materials such as sewage. John V. N. Dorr, Wm. C. Weber, Geo. M. Darby and Elliott J. Roberts (to Dorr Co.). U. S. 2,185,785, Jan. 2. App. is described, and a process of sepg. suspended solids from liquids by concomitant flocculation and sedimentation within a single tank characterized by the maintenance of a disturbed flocculation zone superimposed on a quiescent sedimentation zone, continuously introducing and uniformly distributing the solids-liquid mixt. to be treated over the region constituting the boundary between the flocculation and sedimentation zones, the sedimentation zone being of sufficient depth to dissipate the kinetic energy of the introduced solids-liquid mixt. and permit quiescent settlement of the flocculated particles toward the bottom of the tank where sludge thickening takes place under quiescent conditions, continuously conveying the settled solids to a point of discharge, removing supernatant liquid from the upper portion of the flocculation zone and maintaining in the flocculation zone substantially vertically rising fluid currents and substantially vertically rising and falling solid bodies.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

Physical characteristics of soils. V. The capillary tube hypothesis of soil moisture. Amar Nath Puri. *Soil Sci.* 48, 505–20(1939).—Data are given relating the moisture content and relative humidity of soils. Detns. of capillary force of soils by measuring the max. height to which moisture can rise are fundamentally wrong. This can be done only by completely satg. the soil and applying gradually increasing suction pressure until the capillaries break. This force is correlated with the size of particles.

M. S. Anderson

Factorial diagrams. J. E. A. den Doop. *Soil Sci.* 48, 497–504(1939).—A system of diagrams is proposed for expression of relationships of fertilizer constituents added to crop yields. Also, a similar system is proposed which relates cost of fertilizing to yield of a particular constituent such as starch.

Biochemical methods of structural formation of soil. I. I. Kanivets, N. P. Korneeva and S. F. Morochkovskii. *Vsesoyuz. Nauch.-Issledovatel. Inst. Sakharnoi Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 19–21(1937); *Chimie & industrie* 42, 565; cf. *C. A.* 33, 4724[7].—Tests on the improvement of the structure of soil by inoculation of microorganisms such as *Trichoderma lignorum* and *Aspergillus niger*. Both organisms

increased considerably, after composting, the quantity of soil aggregate resistant to the disintegrating action of water. A. Papineau-Couture 1

A new contribution to a universal objective classification of soils. Emile Huguet del Villar. *Soil Research* **6**, 221–6(1939)(in English).—The increased use of chem. data in classifying soils is advocated, and other features of the system developed by the author (cf. *C. A.* **33**, 3515[4]) are outlined. C. J. Schollenberger

Sodium ferrocyanide as dispersing agent in mechanical analysis of soils. Baradananda Chatterjee and Basanta Kumar Das. *Soil Research* **6**, 227–31(1939)(in English). —Data obtained in a comparison of $Na_4Fe(CN)_6$ and NaOH as dispersing agents in the International-A method of mech. analysis are tabulated and discussed. $Na_4Fe(CN)_6$ is superior to NaOH, as might be expected from the high valence of the anion and its adsorption by soil colloids increasing the neg. charge thereon (cf. R. Mittra, *Proc. 25th Indian Sci. Congr.* III, 223(1938)). Method: To 10 g. soil in a 600-ml. beaker add 50 ml. 6% H_2O_2, heat gently with stirring to break froth. When the reaction moderates, evap. to ½ vol. If much org. matter remains, repeat as necessary. Cool and filter on paper in a Buchner funnel. Leach with about 500 ml. *N* NaCl, 2 × 100 ml. 0.01 *N* NaCl, and 3 × 25 ml. H_2O. Transfer to a 500-ml. shaker bottle with 400 ml. H_2O, add 1 ml. *M* $Na_4Fe(CN)_6$, shake mechanically for about 2 hrs., transfer to a 500-ml. cylinder and pipet off samples as usual. The wt. of suspended material found is corrected for $Na_4Fe(CN)_6$ added. Comparisons indicated that leaching with NaCl as described is as effective as with NaOAc at pH 7. The pH of the suspensions thus prepd. was 6.5–9.5 with the different soils tested, compared with 10.8–11.5 with the regular NaOH method. The results showed that a laterite can be dispersed as well at pH 6.5 with $Na_4Fe(CN)_6$ as at pH 11.3 with NaOH, and the objectionably high alky. of the latter, formerly considered necessary, can be avoided. Eight references. C. J. Schollenberger 2

Absorption of cations by soil. I. A. Geller. *Vsesoyuz. Nauch.-Issledovatel Inst. Sakharnoĭ Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 27–8(1937); *Chimie & industrie* **42**, 566.—In the arable horizon, and partly also in the underlying horizon, the cation-absorption capacity varies proportionally to the org. matter content. At deeper horizons no such relation exists. A. Papineau-Couture 3

Properties of soils related to termite control. I. G. L. Hackenyos *Pests* **8**, No. 3, 10–12(1940).—Soil fumigants such as CS_2 and dichloropentane disappeared most rapidly from loamy soils contg. much org. matter, most slowly from pure sand. H_2O was held most tenaciously by soils. Other chemicals were held in the following order: tar acid oil (most), creosote oil, neutral creosote oil and petroleum oil. Light mineral oils were more easily displaced than more viscous fractions. Water and coal-tar creosote displaced each other very little in soils. The addn. of soap to termite liquids retarded rather than speeded penetration in most soils apparently because of the formation of insol. soaps. The addn. of various com. wetting agents up to 1% had little effect on speed of percolation through soil. Oil penetrates soil faster than water possibly because of (1) lower surface tension and (2) soil shrinkage (whereas water swells soils). Henry H. Richardson 4

The basaltic and associated soils of the far north coast districts of New South Wales. N. H. Barbery. *Dept. Agr., N. S. Wales, Regional Soils Ser.* No. 2, 22 pp. (1939).—Studies were made of the red basaltic soils (I), black basaltic soils (II), alluvial soils (III) and gray podzol soils derived from sedimentary rocks (IV). In most samples of I the degree of unsatn. with bases exceeded 75% and the most significant aspect of the exchangeable-base status was the low values for Ca and Mg; many of the samples were low in exchangeable K, but they were generally high in org. matter. Samples of II were much higher in Ca and Mg than were those of I and the K content was also higher; in many cases the org. matter content was appreciably lower than in I. III contained considerably more Ca (both total and exchangeable) than did I, but the Mg content was less than in II; the K content was fairly satisfactory. IV showed the low base status common to these soils, but in relation to their satn. capacity they were better provided with bases than were many of the laterized basaltic soils. I had pH values of 4.6–5.4; II were less acid. I showed a high Ti content, present as ilmenite in the fine sand fraction. Chem. and Neubauer tests, as well as field expts., showed that I are, in general, very deficient in available P; II and III are much better supplied with P. I showed a very high capacity for adsorbing and fixing sol. phosphates. In lab. expts. fixation equiv. to as much as 135,000 lb. superphosphate per 2.5 million lb. soil was obtained in 5 hrs. and 172,000 lb. in 5 days. In general, fixation of P by II and III was much less than by I. K. D. Jacob 5

Soil deterioration in the canal-irrigated areas of the Punjab. III. Formation and characteristics of soil profiles in alkaline alluvium of the Punjab. Amar Nath Puri, E. McKenzie Taylor and A. G. Asghar. *Punjab Irrigation Research Inst., Research Pub.* **4**, No. 9, 7 pp. (1937); cf. *C. A.* **30**, 3137[7].—A typical profile in the alk. alluvium of the Punjab consists of 3 well-marked layers, (1) an upper highly alk. layer compact and impervious, (2) a layer of medium alky. contg. $CaCO_3$ nodules (kankar), (3) a layer with a lower alky. and higher permeability than (1) and (2), and (4) at lower depths usually sand. Exchangeable Ca is usually low in the surface layer and increases with depth. The hypothesis is advanced that the underground water contg. $CaHCO_3$ in soln. deposits $CaCO_3$ in the form of nodules on coming in contact with alk. Na clay. At the same time the exchangeable Na in the clay complex is replaced by Ca and the Na_2CO_3 produced thereby travels upward and increases the alky. of the upper soil layer. In extreme cases this Na_2CO_3 may reach the surface. The factors that seem to be concerned in the formation of $CaCO_3$ nodules are a high content of exchangeable Na in the surface soil, a high water-table within the reach of the alk. zone and a water-table capable of fluctuating in level. K. B. Jacob 6

Soils of the Isle of Crete. K. Nevros and I. Zvorykin. *Soil Research* **6**, 242–308(1939)(in German with English summary).—The geol. and climatic features contributing to the character of the soils are discussed, with detailed descriptions, fusion and exchange analyses and data for H_2O- and 5% KOH-sol. constituents of numerous profiles. Topography has been most important in soil formation; the steep central mountain mass caused a short, abrupt erosion curve, and skeletal or truncated profiles are widespread. The following regions of soil formation are distinguished: talc schists with siallitic unsatd. soils, frequently red; hard limestones with karst formation (depressed areas over collapsed caverns) and terra rossa and transported soils in all stages of transformation; tertiary marls with light or dark, also red, rendzina soils. In a few parts of the coastal plain there are saline soils which contain principally chlorides of Na and Mg. Twenty-six references. C. J. Schollenberger 7

Rumanian work in soil science 1934–1938. Teodor Saidel. *Soil Research* **6**, 309–18(1939)(in German).—A review with 64 references. C. J. Schollenberger

Reclamation of saline (alkali) soil in the Yakima Valley, Washington. Carl A. Larson. *Washington Agr. Expt. Sta., Bull.* **376**, 5–39(1939).—Excess salts move downward into the subsoil water as a result of abundant irrigation. Corrugations at 3-foot intervals without other cultural practices and copious irrigation during the season were effective in removing excessive sol. salts. About ⅔ of the sol. salts were removed from the surface foot by 2 irrigations when the corrugations were changed between the previous ones. Pptn. causes a marked variation in salt content of the surface 12 in. of soil. The max. elec. conductance for normal plant growth in this type of soil is approx. 200. Cf. Scofield, *C. A.* **27**, 2519. C. R. F. 8

The effect of natural gas on the growth of microörganisms and the accumulation of nitrogen and organic matter in the soil. Horace J. Harper. *Soil Sci.* **48**, 461–6 (1939).—Natural gas escaping from leaking pipes in various parts of Okla. markedly increased the N and org. 9

matter contents of the soils of the areas exposed. The av. N content of 12 gassed soils was 0.203%, while the corresponding content in normal soil was 0.084%. Org. matter in these same gassed soils averaged 6.41%, while the corresponding normal soils had 2.39%. The ratio of org. matter to N was a little higher in the gassed soils than in the corresponding normal group. The activity of microörganisms was favorable in the gassed soils when moisture and temp. conditions were suitable for growth. Dark colored residues which accumulate in soils exposed to natural gas remain for several years after the gas leaks are repaired. M. S. Anderson

The occurrence and activities of Azotobacter and Clostridium butyricum in Victorian soils. R. J. Swaby. *Australian J. Exptl. Biol. Med. Sci.* **17**, 401–23(1939). Edward Eagle

Survival of Azotobacter in soil. H. Katznelson. *Soil Sci.* **49**, 21–35(1940).—Palouse silt loam and 4 soils from the N. J. Agr. Expt. Sta. plots 7A, 7B, 5A and 5B were found to lack *Azotobacter*. The inoculation of *Az. chroococcum* resulted in a sharp decrease in nos., especially in the more acid soils 7A and 5A, where they tended to disappear shortly after introduction. No lytic agents could be isolated. The organism survived in the Palouse soil when Mo and $CaCO_3$ or $MgCO_3$ were added alone or together; i. e., Mo + $CaCO_3$ or Mo + $MgCO_3$. An increase in nos. occurred only in the presence of readily available sources of energy in appropriate concns. (0.5%). At higher concns. (1%) Et alc., Bu alc. and Ca benzoate completely suppressed *Azotobacter*. Alfalfa, straw and manure did not serve as sources of energy. Dried blood was definitely injurious. Phosphate, alone or in combination with various org. materials was inhibitive in concns. of 1 and 0.5%. The repression of *Azotobacter* by K_2HPO_4 was possibly due to successful competition by the soil microflora for nutrients and even to the production by this active population of substances toxic to *Azotobacter*. *Az. chroöcoccum* persisted in soils 5A and 7A only upon addn. of lime. The addn. of readily available sources of energy to soils 7A, 7B, 5A and 5B, in the presence of lime, stimulated multiplication of *Azotobacter* to a certain extent. The organism could be recovered from the limed soils 7B and 5B even after a considerable period had elapsed after inoculation; mannitol or glucose enabled the organism to develop in the presence of $CaCO_3$. *Az. indicum* could not survive in the acid soil 7A for 24 hrs., but in the presence of lime it persisted, and upon addn. of lime and dextrose it multiplied. The disappearance of *Az. chroococcum* from this soil was partly caused by the low pH and the sol. Al but no explanation could be found for the elimination of *Az. indicum* from this soil in 24 hrs. Unsuccessful competition with the microflora and microfauna, the presence of toxic substances and the absence of certain nutrients, such as P_2O_5 and K, may be considered as among the factors responsible for the inability of *Azotobacter* to survive in soils. However, it is possible, by appropriate soil amendments, to establish *Azotobacter* and to stimulate its development in soils originally inimical to it. 42 references. J. R. Adams

The influence of amino acids and proteins on nitrogen fixation by Azotobacter chroöcoccum. J. E. Greaves, Louis Jones and Alice Anderson. *Soil Sci.* **49**, 9–19 (1940).—The results are given of a study of the influence of varying amts. of 17 amino acids and 3 proteins on N fixation by *Azotobacter chroöcoccum*. Tyrosine, *dl*-isoleucine, hydroxyproline and *l*-histidine greatly increase the N fixation. The other amino acids tested, with the exception of phenylalanine and *d*-arginine, both of which retard N fixation, either slightly increase fixation or are without effect. Cystine and *dl*-methionine increase N fixation approx. 20%, and their actions nearly parallel each other throughout the concns. used. Phenylalanine is the only amino acid tested which may occur in soils in sufficient concns. to retard N fixation by *A. chroöcoccum*. Casein and albumin materially increase N fixation by *Azotobacter*, whereas gelatin greatly retards it. J. R. Adams

Characterization of organic materials in soils. N. P. Penchev. *Ann. univ. Sofia, II. Faculté phys.-math.*, Livre 2, **35**, 1–32(in German, 33–4)(1938–39); cf. *C. A.* **32**, 8987[3].—The pressure-time curves for gas evolution (after passage over P_2O_5) during the burning (under approx. 10^{-3} mm. pressure) at approx. 580° of org. materials in soils, with and without the presence of CuO, are used for the characterization of these materials. Such curves are given for gas black, Ceylon graphite, humus acids and several Bulgarian soils. Georges Ayers

Effect of narrow carbon-nitrogen ratio and of naturally occurring tannins in decomposing plant materials upon the production of mucus. J. G. Shrikhande. *Soil Sci.* **49**, 1–8(1940); cf. *C. A.* **31**, 1463[1].—An app. is described for measuring the stickiness of materials as a criterion of mucus formation during decompn. The results are given of a study of the stickiness resulting from aerobic fermentation of 12 different plant tissues without any external source of N, in the presence of $(NH_4)_2SO_4$, in the presence of $NaNO_3$ and with an adjustment of the final reaction with NaOH, H_2SO_4 and tannic acid. The degree of stickiness varies with the final reaction and the degree of decompn. of a particular material. $(NH_4)_2SO_4$ rots are invariably less sticky than rots without any treatments, which are generally less sticky than $NaNO_3$ rots. The protein richness of a plant material seems to have an effect on the degree of rotting but does not seem to have any direct influence on the quantity of mucus. Provided the reaction developed is suitable, production of stickiness during fermentation appears to be independent of the nature of the plant material, with the exception of plant materials contg. tannin. The presence of tannins in refuse tea, tea leaf prunings and gordonia exerts a toxic effect on the microflora concerned in the decompn., and the inhibition of mucus production seems to be a microbial process rather than a chem. one. Production of stickiness indicates the reaction and the nature of fermentation (aerobic or anaerobic) of a fermenting vegetable heap. J. R. Adams

A soil zinc survey in California. P. L. Hibbard. *Soil Sci.* **49**, 63–72(1940).—About 140 samples of soil and rock collected from numerous places in central California were analyzed for Pb and available Zn. Cu, Co and Ni were detd. in some of the samples. In general, the amt. of Zn found was only 1 to 5 p. p. m. Many samples showed that Zn as well as some other minor metals were accumulated in the surface soil by action of vegetation, and that this accumulated Zn was only very slowly leached down because of the high fixing power of soil for Zn. Many samples of rock assocd. with the soil had Zn contents similar to the soil, indicating that the soil was derived from the rock. It seemed probable that soil-forming agencies, excepting vegetation, tended to produce soils having everywhere a similar content of Zn and other minor metals. Though the amt. present may be adequate, the Zn in alk. soils seemed to be relatively unavailable to some species of plants. J. R. Adams

Consistency and physicochemical data of a loess pampaneo soil. I. Physicochemical properties of samples from different depths of a profile. Hans F. Winterkorn and Geo. W. Eckert. *Soil Sci.* **49**, 73–82(1940).—Data on the mech. compn., consistency properties, heat of wetting and sorption of liquids of soil samples from different depths of a profile of loess pampaneo are used as a basis for discussing the various factors which influence the soil-water relationship. A large clay content and a large plastic index indicate rather the potential H_2O-holding capacity of a soil than the behavior of the natural soil toward the action of H_2O *in situ*. The actual behavior of a relatively dry soil system toward H_2O can be represented as a dynamic equil. between the wetting energy of the H_2O and the cohesive forces at play in the soil system. The mechanism of the H_2O attack is a function of the accessibility of the internal surface of the soil. The H_2O sorption in the Winterkorn-Baver app. (cf. *C. A.* **29**, 1557[9]) appears to be more dependent on wetting phenomena and on the amt. of silt present than on the total clay content. The amt. and type of org. material in a soil exert a considerable influence on the behavior of the soil toward H_2O.

The change of the C/N ratio of the org. material with change in depth of the profile is probably of importance. Practically, soil from the surface 8 in. should make a better subgrade for roads than the subsoil. Its preferential wetting with benzene indicates better results in bituminous stabilization. J. R. Adams

Saturation degree of soil and nutrient delivery to the crop. Wm. A. Albrecht and N. C. Smith. *J. Am. Soc. Agron.* **32**, 148–53(1940).—Much larger yields of forage resulted when the nutrients (Ca or P_2O_5) were applied to satd. highly limited soil areas in the immediate root zone rather than to give a low degree of satn. of the soil throughout the plowed layer. Analyses of the crops showed a higher Ca or P_2O_5 content when these nutrients were applied in limited areas than when they were broadcast. The N content of the crops from the plots of limited fertilization was also higher than from the plots where the fertilizer was broadcast although no N fertilizer was used in this work. These data show that in liming and fertilizing the soil, attention must go to the degree of satn. of the soil. J. R. Adams

The influence of degree of saturation of soil colloids on the nutrient intake by roots. H. Jenny and A. D. Ayers. *Soil Sci.* **48**, 443–59(1939); cf. *C. A.* **33**, 9516⁷.—A quant. theory was developed relating base exchange to degree of satn. of soil colloids. The exchangeability of adsorbed K decreases with decreasing degree of satn. The nature of complementary ions markedly affects the relationships. For instance, a K Ca clay releases nearly as much K at 40% satn. as at 100% while a K Na clay releases markedly less K as degree of satn. is decreased. Clay particles having an effective settling diam. of less than 0.2 μ were sepd. from Yolo clay loam. These colloids were leached with salt solns. or electrodialyzed with subsequent addn. of hydroxides. The base-exchange capacity varied from 59 to 67 milliequiv. per 100 g. Excised barley roots were grown in solns. and suspensions (cf. *C. A.* **30**, 8299¹). Special studies were made to ascertain the influence of K concn. and time period on the absorption of K by roots. Max. absorption was reached in about 10 hrs. from K concns. of about 10 milliequiv. in 3 liters. In all cases roots absorbed more K from KCl than from K clay. A satd. soln. of CO_2 replaces a smaller percentage of the K present as the degree of satn. is decreased. From the viewpoint of agricultural practice it is noteworthy that Ca is the least retarding cation in the process of K liberation. This again demonstrates the superiority of neutral Ca-satd. soils. According to the curves given, neutralizing soils with Ca should render K more available. M. S. Anderson

The adsorption of proteins by montmorillonitic clays. L. E. Enaminger and J. E. Gieseking. *Soil Sci.* **48**, 467–73(1939); cf. *C. A.* **33**, 3721⁴.—X-ray diffraction data show that albumin and gelatin are adsorbed within the characteristic expansible portion of the montmorillonite crystal lattice. The proteins are more completely adsorbed in suspensions of low pH values than in suspension with high pH values. Untreated gelatin was more completely adsorbed than gelatin treated with HNO_2 to destroy its basic properties. Adsorption of proteins as cations is probably partly responsible for their combinations with montmorillonite. M. S. Anderson

Content of 0.2 *N* hydrochloric acid-soluble potash in Tyosen soils. II. Hideo Misu. *J. Agr. Chem. Soc. Japan* **14**, 805–23(1938); cf. *C. A.* **32**, 3069⁷.—A further analysis of 0.2 *N* HCl-sol. potash content (A) of different soils in Kokai Province. In both paddy field, and farm field, the clay soil has more A and the sandy field the least A. In general, the soil having more clay has the greater A. Geologically compared, the granite gneiss and Tyosen systems contain the greatest A, and the Heihan system contains the least. Av. A of all cultivated soils is 0.0391% (paddy field 0.0355%, and farm field 0.0425%). S. T.

The genesis of Davidson clay loam. F. Hardy and G. Rodrigues. *Soil Sci.* **48**, 483–95(1939); cf. *C. A.* **34**, 2111⁵.—A study is made of Davidson clay loam soil of North Carolina in comparison with red earth formations of British Guiana and Granada. Quant. chem. methods employed included total analysis of whole materials and of clay fractions, both after fusion and after tri-acid digestion (for quartz), also alizarin adsorption detns. after ignition for free Al_2O_3. A colloidal clay fraction from a red earth sample was subjected to a sulfide-oxalate treatment which resulted in a nearly white clay. This material contained SiO_2 36.8%, Al_2O_3 (gibbsitic) 1%, Al_2O_3 (combined) 30.3%, and Fe_2O_3 9.5%. The SiO_2/Al_2O_3 is very nearly 2, which is that of halloysite. During the treatment about 68% of the Fe_2O_3 and 27% of the SiO_2 were lost. The genesis of the halloysitic component of red earths is believed to be the resilication of gibbsite occurring in the weathering crusts, and chiefly derived from lime-soda feldspars in the parent igneous rock. The Davidson soil profile displays a partially podzolized *A* horizon with slight accumulation of Fe_2O_3 in the B_2 horizon. Much more pronounced differentiation is usually found in the humid tropical red earth profiles. M. S. Anderson

A few determinations of the pH of forest soils. V. T. Aaltonen. *Metsät. Tutkimusl. Julkaisuja* **1937–38**, No. 25, 1–52; *Chimie & industrie* **42**, 902.—On the whole, the acidity of the soils decreased on storage; the decrease is more marked in strongly podzolized soils and is smaller in brown soils and weakly podzolized soils. The pH value of the soil at first increases with depth; the max. is reached at the lower layer of the *B* horizon; beyond this the pH falls, but increases again to the value corresponding to the reaction of the subsoil. A. Papineau-Couture

A comparison of the pH value of some soils from the Netherlands and from the tropics by means of the quinhydrone and the glass electrodes. B. J. Blomberg. *Landbouwkund. Tijdschr.* **51**, 767–71(1939).—The results of comparative tests for pH by the quinhydrone and the glass electrode app. indicate that 24 samples of Dutch soils gave good agreement between the 2 methods, the figures usually being somewhat higher for the glass electrode. Thirty-two samples of tropical soils did not give as good an agreement. Most of the acid soils gave very similar results by both methods, but the soils of higher pH usually gave a considerably lower figure when the glass electrode was used. Harry Humfeld

The "amphoteric" double layer and the double ionic exchange in soils. Sante Mattson and Lambert Wiklander. *Trans. Faraday Soc.* **36**, 306–19(1940).—The highly amphoteric soils, such as the brown and red earths of the Unden series of profiles from Sweden, adsorb and exchange, simultaneously, large quantities of anions and cations at or near the pH at which equiv. amts. of anions and cations are adsorbed. It is found that this exchange takes place according to the mass law as expressed by the Donnan equil. The valence effect expresses itself in the form of maxima in exchange acidity and exchange alky. in dil. solns. A diln. favors the entrance (into the soil complex) of the bivalent and the exit (in the soil soln.) of the univalent ions; a concn. reverses the process. This double ionic exchange has led to the conception of an amphoteric elec. double layer. Victor R. Deitz

Attempts to decrease the infiltration of water through the deep layers of the soil by means of sodium chloride. S. Zolotarev and L. Dachevski. *Sovet. Khlopok* **1939**, No. 6, 31–5; *Chimie & industrie* **42**, 899.—By introduction of sea salt in weakly saline chernozem soils, the loss of water by infiltration through the deep layers can be reduced considerably. The NaCl content should be equiv. to the total absorption capacity of a soil layer at least 20 cm. thick; in the case under consideration, this amounts to about 3.0 kg. per sq. m. of surface. A. P.-C.

A simple apparatus and procedure for the determination of the carbon content of the soil. Bert E. Christensen, Glenn Simkins and Virgil Hiatt. *Soil Sci.* **49**, 51–6 (1940).—A cut and description are given of a simple app., in which either dichromate or iodate is used, for the measurement of either the C content or both the reducibility and C content of the soil. Concd. H_2SO_4 (3 ml.) is added to the reaction chamber which contains the 250-mg. sample of soil and 250 mg. of dichromate or iodate. The temp. of the reaction chamber is maintained between 160 and 180° in a phosphoric acid bath and the reaction

proceeds at this temp. for 20 min. Then, after addn. of 5 ml. of 6 *N* H_2SO_4 plus water, the reaction chamber is flushed out with CO_2. The generated gas passes through 0.5 *N* KI soln. to a slow combustion chamber, where it is held for 2 min. over a fairly red heat. The gas is then collected in $Ba(OH)_2$, 5 ml. of acetone is added to improve the end point and the excess $Ba(OH)_2$ is titrated with 0.05 *N* HCl to the thymol blue end point. The CO_2 formed is calcd. from these data. When iodate is used as the oxidant, charges of the same size are used but the time of heating is increased to 30 min. and the temp. is kept between 185 and 195°. The heating coil in the slow combustion chamber is unnecessary in this case. Preference is given to the use of iodate as the oxidant. Analyses of pure org. compds. show that this procedure is capable of a high degree of precision. The results are given of the detn. of the C content and O consumed values of a no. of soil samples. The principal sources of error that interfere with the measurement of the reducible org. matter are unoxidized inorg. constituents and halides in the soil. The use of both sets of data shows promise as an index of the state of oxidation of soil org. matter.

J. R. Adams

Use of chemical data in the prognosis of phosphate deficiency in soils. John S. Burd and H. F. Murphy. *Hilgardia* **12**, 323–40(1939).—The causes of failure to obtain correlations between plant growth and acid-extractable phosphate of soils are partly inherent and partly tech. The roles of adsorption complexes, hydrogels and acid buffers, as affecting the analytical figures obtained by acid extn. of soils, are outlined. The sp. "acidity effect" of reagents cannot be measured in soils contg. substantial amts. of adsorbing colloids if the anion of the reagent is itself adsorbed by the soil. If acid-extractable phosphate is 9 mg. or more per 100 g. of soil, plants will usually acquire P without difficulty, but the difficulty will be greatly enhanced if the buffer capacity is low and the adsorptive index is high. If the acid-extractable phosphate is intermediate, plants will probably have difficulty obtaining P when the buffer capacity is extremely high, or even in the absence of high buffer capacity when the adsorption index is high. The effect of a high adsorptive power in preventing a plant from acquiring potentially acid-sol. P in the field is directly assocd. with the buffering power of the soil: (1) if the adsorption index is high and the buffering capacity is low, the conditions are highly adverse; (2) if the buffer capacity is high, the adsorption index is of no import in this connection. Chem. data on 14 soils are analyzed in the light of these findings to illustrate how the present physiol. supplying power of the soil can be deduced. Tentative standards are suggested as a basis for predicting the current phosphate-supplying power of soils.

C. R. Fellers

Determination of the mobile forms of organic matter in peats and soils of the podzolic zone. Ya. V. Pelve. *Chemisation Socialistic Agr.* **7**, No. 10, 64–73(1938); *Chimie & industrie* **42**, 726.—A direct method based on the biol. evaluation of mobile forms, liberated chemically, from the org. matter of humus and from Ca humates. Peat and soil liberate 2 forms of mobile org. matter: (1) treatment of peat or soil with 0.02 *N* NaOH exts. humic acid or α-humates; (2) treatment with 2% $(NH_4)_2C_2O_4$ exts. Ca humates or β-humates. Org. matter is detd. in the exts. by coagulating with HCl and comparing with a standard scale.

A. Papineau-Couture

Calcium-salt resources of Tartary in relation to soil fertility. V. Makarov. *Uchenye Zapiski Kazan. Gosudarst. Univ.* **98**, No. 4, 3–21(1938).—Various deposits of Ca salts (chiefly $CaCO_3$) found in the Tartary U. S. S. R. are described. Directions for addn. of Ca salts to various soils are given.

B. C. P. A.

Determination of the salt content of soil and of water by means of a galvanic couple. M. Budanov. *Sovet. Khlopok* **1939**, 67; *Chimie & industrie* **42**, 566.—The method is based on the property of galvanic couples of creating in electrolytes an e. m. f. which is proportional to the amt. of dissolved salts and which is measured by means of a galvanometer. A temp. correction is applied.

A. Papineau-Couture

Occurrence of available potassium in orchard soils. I. W. Wander and J. H. Gourley. *Proc. Am. Soc. Hort. Sci.* **35**, 326(1938); cf. *C. A.* **33**, 7459[2].—K fertilizers applied to these soils were rapidly rendered unavailable, and after 10 years' continuous treatment penetration of available K was not greater than 6 in. Continuous heavy mulching maintained high available K contents to a depth of 2–3 ft.

B. C. P. A.

Methods of measuring soil erosion. Helmut Kohnke and F. R. Dreibelbis. *Soil Research* **6**, 232–41(1939) (in English).—The methods for investigating removal of soil and fertility elements from the erosion plots at Coshocton, Ohio, are briefly described. The usual Soil Conservation Service method is a comparison of the existing soil profile with that of the nearest virgin soil of the same type and topography. Its principal defect is that the thickness of the *A* horizon naturally tends to vary inversely with the slope. The sediment survey method depends upon an estimate of the amt. of soil deposited at the foot of the slope, or wherever deposition occurred; it probably does not include the colloidal materials carried beyond that point in the runoff. Other methods det. the erosion as it occurs—the runoff is sampled and measured and its load of soil or content of fertility elements detd. in the lab. A 5.4 acre field of silt loam residual from sandstone and shale with 5–20% slope, first cultivated 100 yrs. ago, was estd. from decrease in depth of the originally 8-in. *A* horizon and from the amt. of sediment deposited to have lost 400 tons/acre of soil during the 20 yrs. it was in corn, 90 tons in 15 yrs. in oats, 90 tons in 15 yrs. dropped to wheat, 20 tons in the remaining 50 yrs. in pasture. The indications at present being obtained from plots by runoff sampling methods are in line with the foregoing.

C. J. Schollenberger

Increasing and stabilizing crop yields on so-called "moorland heath" diseased sand and humus soils. C. Husemann. *Z. Pflanzenkrankh. Pflanzenschutz* **47**, 211–32 (1937).—On these Cu-deficient soils crop yields were improved by loosening the subsoil and by heavy applications of fertilizers. K phosphates, applied in the autumn, were beneficial, and treatment with K_2SO_4-$MgSO_4$ shortly before planting gave good results. Supplementary applications of $CuSO_4$ markedly increased yields in all cases.

B. C. P. A.

An investigation of the effect of continued applications of Chilean nitrate of soda and of ammonium sulfate on the properties of a soil. H. J. Hardon. *Landbouw.* **15**, 309–23(1939).—A report of a lab. examn. of samples of soil from fertilizer test plots on the East Coast of Sumatra. The soil was classified as an acid, white, dacite-liparite-tuff loam. In the series of test plots, some received yearly applications of Chilean nitrate of soda and others NH_4 sulfate, while the controls received no fertilizer. Continued fertilization with Chilean nitrate of soda for 17 years resulted in a considerable increase in exchangeable sodium. About two-thirds of the quantity applied was present as absorbed sodium in the 0–40 cm. layer of soil. This absorption was considered large as the annual rainfall was 246.4 cm. as there was no pronounced dry season. The applications increased the pH of the soil, reduced its permeability and increased the dispersibility of the clay fraction. The NH_4 sulfate treatment had an opposite effect. There was an increase in acidity and the rate of leaching of Ca was increased. The dispersibility of the clay fraction was reduced to some extent and the permeability was increased. The $SiO_2 \cdot Al_2O_3 + Fe_2O_3$ ratio of the soil fertilized with Chilean nitrate of soda was higher than that of the soil fertilized with NH_4 sulfate.

H. H.

Effect on perennial grasses of the physicochemical condition of the soil. V. A. Chorny. *Chemisation Socialistic Agr.* **7**, No. 10, 74–6(1938); *Chimie & industrie* **42**, 725.—Perennial grasses produce a strong soil structure, the effect being more marked according as the grasses are older. The quantity of CaO and of MgO absorbed, and the amt. of total humus, of N and of N in the humus also

increase with the age of the grasses. The quantity of P varies in the opposite direction. A. Papineau-Couture

The assimilation of phosphatic fertilizers as a function of the soil reaction. A. A. Sanfourche and B. Tallibart. *Compt. rend. acad. agr. France* **26**, 123–8(1940); cf. *C. A.* **34**, 1798⁴.—The Neubauer method, using winter rye, was used to det. the availability of the P_2O_5 of basic slag or superphosphate as a function of the soil reaction. A sand medium was used and the phosphatic material was added at the rate of 0.0585 g. P_2O_5 per test. The sand was mixed with pptd. $CaCO_3$ for the alk. soil, which had a pH of 7.5. The acid soils were formed by mixing the sand with K diphthalate soln. which was more or less neutralized with soda so as to give any desired pH. In the alk. and neutral soils, the availability of the P_2O_5 of superphosphate was greater than the availability of the P_2O_5 in the slags and the latter showed a little higher P_2O_5 availability than natural phosphate. In slightly acid soils (pH 6.0) the superiority of superphosphate over the slags was not as great while the superiority of the slags over the natural phosphate was greater. In the very acid soils (pH 5.0) the P_2O_5 availability of the slags surpassed that of the other 2 sources of P_2O_5. The soly. of the slag in acid soils was attributed to its constitution. The low availability of natural phosphate and tricalcium phosphate was attributed to their apatitic constitution. J. R. Adams

Direct and secondary action of chloropicrin on crops as a function of the nature of the soil and of the mineral fertilizers. D. M. Guselnov. *Chemisation Socialistic Agr.* **7**, No. 8–9, 74–7(1938); *Chimie & industrie* **42**, 733.—The effectiveness of chloropicrin depends not only on the quantity and nature of the org. matter of the soil, but also on the mineral compn. of the soil, the nature of the fertilizer and certain other conditions. The increase in crop yield produced by the application of chloropicrin is due to improvement in the conditions of nutrition of the plants; more particularly, chloropicrin reduces the transformation of nutritive elements into forms which are not available to the plants. A. Papineau-Couture

Mineral nutrition of fodder cabbage. E. V. D'yakova. *Chemisation Socialistic Agr.* **7**, No. 8–9, 95(1938); *Chimie & industrie* **42**, 735.—The cultivation of fodder cabbage requires increased amts. of fertilizers: about 120 kg. per ha. of N and of K_2O and about 90 kg. per ha. of P_2O_5. Na_2HPO_4 is preferable to phosphorite which is not so well utilized by cabbage. K_2SO_4 gives better results than KCl, and still more so than sylvinite. A. Papineau-Couture

Effects of varying amounts of nitrogen, potassium and phosphorus on growth and assimilation of young apple trees. L. P. Batjer and E. S. Degman. *Proc. Am. Soc. Hort. Sci.* **35**, 255(1938).—In sand-cultured, 1-year trees diminution in N content of the nutrient below 60 p. p. m. caused proportionate decrease in growth. Deficiency symptoms appeared with less than 10 p. p. m. of K, but growth increased with K supply up to more than 60 p. p. m. Approx. uniform growth occurred with all P concns. exceeding 4 p. p. m., and visible deficiency symptoms were apparent only when P was omitted from the nutrient. Rates of photosynthesis diminished rapidly as the N concn. and to a smaller extent when K concn. was lowered. Trees grown in low-N nutrients until the terminal bud had formed and then transferred to high-N media showed marked increase in leaf color and CO_2 assimilation within 7 days. B. C. P. A.

Comparative effects of organic and mineral fertilizers in the cultivation of Italian hemp. M. K. Altukhov. *Chemisation Socialistic Agr.* **7**, No. 8–9, 95(1938); *Chimie & industrie* **42**, 725.—It was observed that the application of 30–40 tons of manure per ha. produced results equiv. to the application of a complete N-P-K fertilizer at the rate of 90 kg. of each element per ha. It is advantageous to combine smaller amts. of manure with appropriate amts. of N-P-K fertilizers. A. Papineau-Couture

Peat as a source of nitrogen (plant) food. N. S. Rozanov and T. S. Krnatian. *Chemisation Socialistic Agr.* **7**, No. 8–9, 96(1938); *Chimie & industrie* **42**, 725.—Peat contains a considerable proportion of N, largely in the form of amines, which can be activated by hydrolysis. At the present time the most rational method of activation consists in composting peat with manure, liquid manure and lime. A. Papineau-Couture

Vivianite as a fertilizer for flax crops. Ya. V. Pelve. *Chemisation Socialistic Agr.* **7**, No. 8–9, 96–7(1938); *Chimie & industrie* **42**, 725.—In vivianite P_2O_5 is combined chiefly with Fe. It can be used as a source of P_2O_5 in both weakly and strongly podzolized soils. To obtain max. effect from it, the soil must be limed and nitrate fertilizer applied; under these conditions, the effect of vivianite on flax is not inferior to that of superphosphate or of phosphorite. A. Papineau-Couture

Effect of the systematic use of different forms of nitrogenous fertilizers. Nichik. *Chemisation Socialistic Agr.* **7**, No. 8–9, 63–8(1938); *Chimie & industrie* **42**, 725.—The expts. were carried out on a clayey podzolized soil. With beet, $NaNO_3$ applied over a basal application of P and K gives better results than the other forms of N, which is due not only to the physiol. alky. of the compd., but probably also to the form of the N and possibly also to the presence of Na. Ca cyanamide also produced favorable results, though not quite as good as $NaNO_3$, while NH_4 salts give neg. results. A. P.-C.

Mobility of phosphoric acid in the soil: technique for the application of superphosphate in the cultivation of sugar beets. Gorshkov. *Chemisation Socialistic Agr.* **7**, No. 8–9, 94(1938); *Chimie & industrie* **42**, 725.—The degree of absorption of P_2O_5 from superphosphates depends on the size of the fertilizer particles and their contact with the soil. Tests carried out with sugar beets showed that the greatest activity is possessed by particles 2–5 mm. in diam., coarser and finer fractions both giving poorer results. The large fertilizer particles are probably not readily accessible to the plants owing to their irregular distribution throughout the soil, while the P_2O_5 of the finer particles is probably strongly fixed by the soil. A. P.-C.

Increasing the efficiency of the liming of acid soils in crops which are sensitive to excessive amounts of lime. M. V. Katalymov. *Chemisation Socialistic Agr.* **7**, No. 8–9, 93–4(1938); *Chimie & industrie* **42**, 725.—Application of B to soil not only permits of overcoming the harmful effect of excessive amts. of lime on crops which are sensitive to liming, but also produces a supplementary beneficial effect. A. Papineau-Couture

The presence of rhizogenic substances in certain natural media. Raymond Chaminade and Jean Boucher. *Compt. rend. acad. agr. France* **26**, 69–76(1940).—Tests with geranium plants showed that the root formation of slips was not accelerated nor the root system improved by the use of exts. from garden soil, moor soil, leaf mold, manure or hot-bed mold. The last 3 even appeared to have a depressive effect. The slips treated with peat exts. showed a marked improvement in their root system. Ivy exts. accelerated the root production and increased the quantity of roots produced. J. R. Adams

Forage production on irrigated Crau soil: role of phosphatic fertilizer. L. Maume. *Compt. rend. acad. agr. France* **26**, 97–103(1940); cf. *C. A.* **33**, 5933⁹.—The use on irrigated Crau soil of superphosphate at the rate of 250 kg. of P_2O_5 per hectare almost doubled the total hay yield for the season (3 cuttings) and increased the proportion of leguminous plants in the hay. The protein content of the crop was increased 2.3 fold. J. R. Adams

Economic return from fertilizers in Brittany. P. Boischot and J. Herviaux. *Compt. rend. acad. agr. France* **25**, 1099–1105(1939).—On the granitic soils of Brittany the use of nitrogenous fertilizers is advisable for cereals up to applications of 30 kg. per hectare and up to 60 kg. for potatoes. Beets and clover derive no benefit from these fertilizers. K_2O fertilizers at the rate of 140 kg. K_2O per hectare increase beet yields. Even though P_2O_5 and K_2O fertilizers are of no advantage to the other crops of the rotation (wheat, barley, oats, clover) during the yr. of application, annual addns. of 100–150 kg. of K_2O and 70–80 kg. of P_2O_5 are necessary to maintain the fertility of the soil. J. R. Adams

Effect of waste sulfite liquor on soil properties and plant growth. J. B. Spulnik, R. E. Stephenson, W. E. Caldwell

and W. B. Bollen. *Soil Sci.* **49**, 37–47(1940).—Waste sulfite liquor in concns. below 80 tons per acre was not toxic to sunflowers grown on Newberg loam. It was a satisfactory source of S for sunflowers grown on S-deficient soils. Treating the soil with waste sulfite liquor increased the concn. of K, Ca and sulfate in the water ext. of the soil and decreased the nitrate content. Waste sulfite liquor increased the rate of CO_2 evolution in the soil, indicating an increased org. decompn., and increased the microbial population in the soil. Waste sulfite liquor addns. to Newberg loam soil lowered the pH of the soil suspension; on incubation the pH gradually increased. J. R. Adams

Balanced fertilization for apple orchards. M. B. Davis. *Better Crops with Plant Food* **24**, No. 2, 6–10, 43–6(1940).—The role of the major elements as affecting leaf and tree characters is discussed. Drought spot, cork or internal cork and corky core are fruit diseases which are corrected by B. J. R. Adams

The effect of the additions of calcium ions and of sodium ions in fertilizing with nitrates. J. Hudig and J. J. Lehr. *Landbouwkund. Tijdschr.* **51**, 654–781(1939).—The effect of $Ca(NO_3)_2$ is compared with that of $NaNO_3$, with the addns. of various amts. of K. A sandy soil, with a pH of 6.5, 3.4% humus and 4.3% fraction of 2 μ was used in pot expts., in which 6.8 kg. soil per pot was used. The soil contained per 100 g., 54 milliequivalents Ca, 3.0 K, 0.9 NH_4 and 4.3 Mg. $Ca(NO_3)_2$ and $NaNO_3$ were added at the rate of 2400 mg. N, without and with addn. of 6310 γ B per pot. Sugar beets were grown. Total green and total dry weight, green and dry weight of beets, dry weight of leaves and weight of sugar were reported. Results indicate that Arcadian nitrate and B gave the highest yield, followed by Chilean nitrate, Arcadian nitrate, $Ca(NO_3)_2$ plus B and $Ca(NO_3)_2$ alone, in the order named. The larger addns. of K as a rule increased the yield slightly, possibly not a sufficient amt. to warrant the larger applications. Harry Humfeld

Providing plants with boron and cyclic salt. C. H. Edelman. *Landbouwkund. Tijdschr.* **51**, 650–3(1939).—Cyclic salt is salt which is picked up by the wind in small droplets of sea water and deposited by snow and rain on the soil. The coastal plains of the Netherlands are calcd. to receive an average of 80 kg. per hectare per year. About 80 g. of this is B_2O_3. The B content of soils is very low and it seems probable that the B supplied in this manner plays an important part in the nutrition of plants grown on these soils. Harry Humfeld

The effect of iron and aluminum on the quality of Ammophos. Sand cultures. A. V. Sokolov, L. I. Obolenskaya and N. V. Koshel'kova. *Trudy NIUIF, Shornik "Fosfor. Udobr. i ikh Kachestva."* No. **141**, 98–104(1938); *Khim. Referat. Zhur.* **2**, No. 3, 93(1939).—Treatment of different kinds of Ammophos with excess water gave residues (as a result of hydrolysis) which contained the main part of P_2O_5 and N in the citric-sol. form and small amts. of water-sol. N and P_2O_5. Vegetation expts. showed that the Ammophos residues are less available to plants than the phosphates of NH_4. $NH_4H_2Fe(PO_4)_2$ and $NH_4H_2Al(PO_4)_2$, like the Ammophos residues, contain water-insol. N and P_2O_5. They are inferior to the mech. mixts. of $NH_4H_2PO_4$ and RPO_4 in availability of P_2O_5 to plants. The presence of similar compds. in Ammophos is possible. The water-insol. Ammophos residue consists of the citric-sol. $NH_4H_2Fe(PO_4)_2$ and of a citric-insol. substance of the approx. compn. $NH_3.2FePO_4.4H_2O$. N cannot be detd. in Ammophos by aq. extn.; it is detd. by distn. of NH_3 from a HCl ext. prepd. for the detn. of the total P. W. R. Henn

The potash content of meadow hays from different fertilized and unfertilized soils. B. Tacke. *Ernähr. Pflanze* **36**, 31–2(1940).—Expts. over a period of 10 yrs. showed that the av. K_2O content of air-dried hay from high and low moor soils which received adequate fertilizers was 2%. John O. Hardesty

Transformation of organic matter and nitrogen in manure as a function of storage conditions. I. F. Romashkevich. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 2, 29–40(1939); *Chimie & industrie* **42**, 901.—Great decompn. of manure and intense humification of its org. matter during storage produce considerable loss of org. matter and of N, and result in a decrease in soly. of the N compds., of the coeff. of utilization of the N by plants and of the quality of the org. matter. A strongly degraded manure is therefore less effective than normal manure. A. Papineau-Couture

Tests on the fertilization of citrus crops. V. Belyaeva. *Sovet. Subtropiki* **1939**, No. 1, 50–1; *Chimie & industrie* **42**, 905; cf. *C. A.* **34**, 1352[8].—Generally speaking, farm manure sufficiently enriches the soil in nutritive elements required for citrus plants: P, K, Ca, Mg and S. In certain cases it is advisable in addn. to spray the trees with Zn salt solns. when the Zn content of the soil is too low. From 0.9 to 1.4 kg. of available N is required per tree; but a considerable portion of this quantity is not used but is removed from the soil by atm. pptns., irrigation, etc. A. Papineau-Couture

Mineral fertilizers as a means of increasing the resistance of plants to drought. K. S. Mirolyubov. *Sovet. Botan.* **1938**, No. 4–5, 89–110; *Chimie & industrie* **42**, 725.—P and K fertilizers increase the resistance of plants to drought whether they are applied at sowing or before haytime. N and complete fertilizers exert a pos. action in this respect only if applied before haytime; when applied at sowing they decrease the resistance of the plants to atm. or soil drought. A. Papineau-Couture

Nitrogen fertilization in pine forests. N. P. Remezov. *Sovet. Botan.* **1938**, No. 6, 34–51; *Chimie & industrie* **42**, 725.—Pine consumes larger quantities of N than of the other nutritive elements. A study of the nitrogenous nutrition of the Briansk pine forests shows that the greater portion of the org. N compds. of the soil undergoes hydrolysis. The ammonifying and nitrifying powers of pine-forest soils vary during the course of vegetation; on the whole, ammoniacal nutrition predominates, though in certain cases nitric nutrition is also possible to a slight extent. A. Papineau-Couture

Effects of fertilizers on the crop and chemical composition of summer wheat. A. M. Sveshnikov, R. L. Sai, V. V. Staroverova and G. I. Nevskaya. *Chemisation Socialistic Agr.* **7**, No. 8–9, 91–2(1938); *Chimie & industrie* **42**, 725.—N fertilizers increase the protein content and decrease the starch content of the grain. K fertilizers produce the opposite effect. P fertilizers act in the same way as K fertilizers, but not so strongly. A. P.-C.

Effect of molybdenum on red clover crops. K. A. Dmitriev. *Chemisation Socialistic Agr.* **7**, No. 10, 80–1(1938); *Chimie & industrie* **42**, 726.—Mo applied with B over CaO + P and K produces a strong pos. effect on the yield of red clover seed. The quantity of CaO must be equiv. to once or twice the hydrolytic acidity of the soil. A. Papineau-Couture

Periodicity of mineral nutrition of plants as a factor in improved yield and quality of crops. I. G. Dikussar. *Chemisation Socialistic Agr.* **7**, No. 11, 28–37(1938); *Chimie & industrie* **42**, 726.—The periodicity of the nutrition of plants is due to the fact that the cycle of the vital development of the plant comprises several stages which differ from one another both as regards the general level of nutrition and as regards the ratio between the various nutritive elements. Mineral nutrition must include all the elements necessary to plant life. The N nutrition, however, exerts a very powerful and varied effect which governs the physiol. condition of the organism as a whole. Judicious dosage of N during the different stages is therefore particularly important. During germination and the early stage of life the nutritional level (especially nitric) must be relatively low. On the contrary, it must be max. during the formation of the aerial organs of the plant. A. Papineau-Couture

Efficiency of potash fertilizers in peat bogs. II. M. D. Bakhulin. *Chemisation Socialistic Agr.* **7**, No. 10, 78–80(1938); *Chimie & industrie* **42**, 726; cf. *C. A.* **33**, 6506[1].—All sol. K fertilizers are suitable for fertilizing peaty soils, and permit of obtaining max. crops of beets and other cultivated plants, provided sufficient quantities of N and

of P are applied. The complementary effect of K fertilizer in peaty soils is very marked and there is no danger of washing out of the K nor of its fixation by the peat. Insol. K fertilizers produce a retarding effect (during the second half of the vegetative period), and they must be applied early and in larger quantities than the sol. fertilizers. A. Papineau-Couture

Distribution of microörganisms and of the soluble forms of nitrogen in the various "zones" of agglomerations of the soil. I. I. Kanivets and N. P. Korneeva. *Vsesoyuz.-Nauch.-Issledovatel. Inst. Sakharnoĭ Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 21-3(1937); *Chimie & industrie* **42**, 565; cf. *C. A.* **33**, 4724⁷.—The soil aggregates most resistant to water are those of 1–10 mm. size; next come those larger than 10 mm. The first-named aggregates are the richest in easily sol. N. The largest nos. of bacteria are found in the 1-20-mm. aggregates; they occur mostly at the surface of the aggregates. A. Papineau-Couture

Fertilization of beet crops. I. I. Shaposhnikov and F. Yu. Adamenko. *Vsesoyuz. Nauch.-Issledovatel. Inst. Sakharnoĭ Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 67–9(1937); *Chimie & industrie* **42**, 566.—Complete mineral fertilizers give at least as good results as manure, especially on podzolized soils. Application in the fall of a mixed N-P fertilizer is less effective than that of a complete fertilizer. The effect of dild. fertilizers is the stronger according as the solr. is introduced nearer the roots. A. Papineau-Couture

Influence of dressing on the development of the root system of the sugar beet. S. I. Slukhai. *Chemisation Socialistic Agr.* (U. S. S. R.) **7**, No. 11, 80(1938); *Chimie & industrie* **42**, 548.—Nitrogenous dressing ($NaNO_3$) over a K-P fertilizer produces an increase in the no. of lateral roots of the sugar beet, especially at a depth of 10–20 cm. At greater depths (30 cm. and over) there was no such effect. At the same time, there was noted an increase in crop yield. A. Papineau-Couture

Manganese fertilizer. P. A. Vlasyuk. *Vsesoyuz. Nauch.-Issledovatel. Inst. Sakharnoĭ Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 52–5(1937); *Chimie & industrie* **42**, 729.—Mn accelerates the decompn. of org. matter in the soil, stimulates microbiol. processes, raises the electrokinetic potential of soil colloids and increases the amts. of H_2O-sol. forms of N, P and K. In the plant, Mn governs an activation of N, P and K, accelerates photosynthesis, contributes to the accumulation and migration of sugars and improves N metabolism and other physicochem. and physiol. processes. A. Papineau-Couture

Organic fertilizers as a source of carbon dioxide. V. A. Tyulin. *Chemisation Socialistic Agr.* **7**, No. 11, 52–8 (1938); *Chimie & industrie* **42**, 726.—Org. fertilizers introduced into the soil or just applied to the surface can constitute a source of aerial nutrition for plants through carbon dioxide. They permit of increasing considerably (two- or three-fold and even more) the concn. of CO_2 in the lower layers of the atm., which accelerates the development and ripening of the plants, increases the crop yield and raises the proportion of leaves. In the case of potatoes, the increase in crop yield under the influence of CO_2 is governed chiefly by the accumulation of starch and dry matter in the tubers. A. Papineau-Couture

Effects of farm manure and mineral fertilizers on soil humidity. L. B. Saksaganskiĭ and M. V. Malych. *Chemisation Socialistic Agr.* **7**, No. 11, 79(1938); *Chimie & industrie* **42**, 726.—Tests carried out over a period of 6 yrs. on sugar-beet crops showed that manure produced an increase in the moisture reserves of the soil and moreover intensified the water-nutrition of beets. N-P-K fertilizers had very little influence on soil humidity. A. Papineau-Couture

Effect of fractional application of nitrogenous fertilizers with irrigation on the crop yield and quality of summer wheat. M. M. Morozov. *Chemisation Socialistic Agr.* **7**, No. 11, 81(1938); *Chimie & industrie* **42**, 727.—Fractional application of N fertilizers produces a pos. effect on plant nutrition and avoids the N deficiency which is observed after the simultaneous application of the whole amt. of fertilizer with intense irrigation. A. P.-C.

Influence of artificial fertilizers on the photosynthetic efficiency of Andropogon sorghum. B. N. Singh, K. N. Lal and M. B. Lal. *Proc. Indian Acad. Sci.* **9B**, 151–68 (1939).—The influence of fertilizers [$(NH_4)_2SO_4$, double superphosphate and K_2SO_4] on the photosynthesis, chlorophyll content and respiration rate has been studied in different amounts and in different combinations on *A. sorghum* (var. Cawnpore 46). When supplied singly K_2O and P_2O_5 fertilizers are more effective than nitrogenous fertilizers in increasing the photosynthetic efficiency (P. E.) of leaves; with each the photosynthesis rises with increasing amt. of fertilizer up to a certain optimum level and later declines. Addn. of mixts. of the 3 fertilizers (in varying proportions) has less effect on P. E. than optimum doses of K_2O and P_2O_5 applied singly. This is probably due to the decrease in the rate of CO_2 intake by leaves; when one or other is reduced or removed P. E. increases. The effect of fertilizers on respiration and chlorophyll content is analogous to the effect on photosynthesis since in general an increase in assimilatory activity is followed by an increase in respiration and chlorophyll. The possible mechanisms of the photosynthetic augmentation under the influence of fertilizers are discussed. B. C. P. A.

Peculiarities of nitrogenous nutrition of the sugar beet during the early stages of vegetation. I. F. Buzanov. *Vsesoyuz. Nauch.-Issledovatel. Inst. Sakharnoĭ Prom., Osnovnye Vyvody Nauch.-Issledovatel. Rabot V. N. I. S.'a* **1936**, 45–6(1937); *Chimie & industrie* **42**, 546.—Before the onset of photosynthesis, the germ and young shoots of beets not only do not require any nitrogenous food, but are adversely affected thereby. This explains why N introduced in the soil with sugar-beet seed lowers the crop yield as compared with the cases where the same quantity of N fertilizers was applied at the side of the seed. A. Papineau-Couture

Effect of chlorinated potash fertilizers on crop yield and resistance to cold of red clover. V. V. Koperzhinskiĭ. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 2, 51–6 (1939); *Chimie & industrie* **42**, 901–2; cf. *C. A.* **34**, 1711⁶.—Red clover is very sensitive to the Cl content of the soil and of fertilizers. Chlorinated potash fertilizers, especially sylvinite, do not increase red clover crop yield as much as K_2SO_4; when the K deficiency is slight, it is irrational to use sylvinite. This latter fertilizer, and also to some extent 40% potash salt, influences the biochem. processes related to the resistance of red clover to cold. A. Papineau-Couture

The function of liming light podzolic soils which have received acid mineral fertilizers. V. N. Prokoshev. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 2, 41–50 (1939); *Chimie & industrie* **42**, 902.—Prolonged application of acid mineral fertilizers (especially ammoniacal) to a light sandy or clayey podzolic soil produces a large decrease in crop yield as a result of the increase in hydrolytic and exchangeable acidity of the soil and in mobile Al, and of the inhibition of the microbiol. activity. Liming corrects this; the amt. of CaO required corresponds to 50–100% of the hydrolytic acidity of the soil. A. P.-C.

Effect of soil improvers on summer wheat crops under conditions of drought. A. M. Shelegov. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 4, 26–30(1939); *Chimie & industrie* **42**, 902.—By combining the application of mineral fertilizers and manure before sowing, with a complementary application of N, P and K, the crop yields are increased. It is not advisable, however, to include as much K in the complementary as in the main application; e. g., best results were obtained with 20 N, 30 P and 20 K in the main application and 20 N, 15 P and 10 K in the complementary application. A. P.-C.

Complementary application of nitrogen to winter cereals during the spring months. V. N. Prokoshev. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 4, 18–21(1939); *Chimie & industrie* **42**, 901.—N fertilizers applied before sowing are less effective than the same amts. applied after

sowing. Max. effect is obtained when N is applied late in the fall or early in the spring. A. Papineau-Couture

Effectiveness of complementary application of nitrogen to winter wheat during the spring months. I. N. Kuksa. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 4, 22–5 (1939); *Chimie & industrie* **42**, 902.—Under the conditions prevailing in the soil zone other than chernozem, max. crop increase of winter wheat is obtained if a complete fertilizer is used for the complementary application; the chief part, however, is played by the N fertilizers. A. Papineau-Couture

Water culture experiments relating to the question of [antagonism between] calcium and potassium. F. Alten and H. Orth. *Ernähr. Pflanze* **36**, 13–16(1940).—Nutrient solns. contg. 12 mg. equiv. of cations per 1.6 l. gave optimum development of oat plants when the proportions of K, Ca, Na and Mg were 6.5, 3, 2 and 0.5 mg. equiv., resp. Increasing the Mg content of the soln. to 4 mg. equiv. increased the reactivity of the plant toward any change in the ratio K:Ca. In this respect the highest value for fresh wt. of crop occurred when K:Ca = 5:1 mg. equiv. per 1.6 l. soln. K-deficient plants did not develop properly and they completely absorbed Na as it was supplied. Ca-deficient plants contained no more Na than plants which were normally fertilized. Vegetative growth was better and the uptake of Mg was less with 0.5 than with 4 mg. equiv. of Mg in the nutrient soln. Utilization of surplus Ca in the nutrient soln. was retarded by deficiency of K. Uptake of K decreased with increasing amts. of Ca in the nutrient soln. and was further decreased by increasing the Mg content of the soln. Extreme deficiency of K and excess of Ca diminished the yield about 75%; the reverse condition, about 20%. The total amt. of K, Na, Ca and Mg in the plant ash remained nearly const. in spite of the great variation in the quantity of nutrients supplied. John O. Hardesty

Mineral fertilizers as a means of overcoming wind-blown wheat. I. A. Volkov. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 4, 31–9(1939); *Chimie & industrie* **42**, 902.—Increased P application accelerates the development of the stalk and thereby increases the resistance to wind. N fertilizers, on the contrary, retard stalk development. K fertilizers contribute to the formation of mechanically weak stalks. A. P.-C.

Effectiveness of the fertilization of barley under drought conditions. Ya. I. Til'man. *Chemisation Socialistic Agr.* (U. S. S. R.) **8**, No. 4, 49–51(1939); *Chimie & industrie* **42**, 902.—Manure and mineral fertilizers produce a considerable increase in barley crop yield, even under drought conditions. The effectiveness of the fertilizers depends on the crop that preceded the barley and also on the preliminary soaking of the seed. A. P.-C.

The role of kaolinite in phosphate fixation. H. F. Murphy. *Hilgardia* **12**, 343–82(1939).—Soils with a kaolinic type of clay have a high capacity to fix sol. phosphates, as is shown by both greenhouse and field expts. Phosphate fixation by the various iron systems alone is not considered sufficient to account for all the properties that these soils show with respect to phosphate availability. Kaolinite when ground to colloidal dimensions has a high phosphate-fixing capacity. The fixation is greatest at acid reactions and this indicates that the H_2PO_4 ion is the most favored phosphate ion for the reaction. An increase in base-exchange capacity accompanies the increase in phosphate fixed. Greenhouse expts. show that the availability of the phosphate in the "kaolinite phosphate" is directly proportional to the degree of phosphate satn. This is taken to indicate that a light phosphate fertilizer application would be ineffective on soils having a kaolinic kind of clay. Even a little kaolin in soils, if in a colloidal condition, will bind the phosphate and make it unavailable to plants. Bentonite has a much lower capacity to fix P in an inaccessible form for plant growth than does colloidal kaolinite. The results are considered sufficient to explain why soils with a kaolinic type of clay have a high capacity to fix phosphate and a low phosphate availability as measured by plant growth. 51 references. C. R. Fellers

Effect of soaking cottonseed in a nutritive solution on the rate of germination. T. Ivanovskaya. *Sovet. Khlopok* **1939**, No. 2, 56–7; *Chimie & industrie* **42**, 724.—Soaking cottonseed in a soln. contg. KH_2PO_4 1, NH_4NO_3 2.40, $MgSO_4$ 0.60, KCl 1.50 and $FeCl_3$ 0.25 g. in 10 l. gave pos. results in every case and accelerated germination irrespective of the nature of the soil and the variety of the seed. A. Papineau-Couture

Symptoms of citrus malnutrition in Florida. A. F. Camp and B. R. Fudge. *Florida Agr. Expt. Sta., Bull.* **335**, 3–55(1939); cf. *C. A.* **33**, 3949[3], 5572[1].—Deficiencies in plant nutrition due to Cu, Zn, Mn, Mg, Fe, B and N and B toxicity are described with the aid of photographs in color. 196 references. C. R. Fellers

Effect of nitrogen, phosphorus and potassium in fertilizers on the earliness of cotton. H. B. Brown and H. W. Pope. *Louisiana Agr. Expt. Sta., Bull.* **306**, 3–15(1939).—P increases early flowering and fruiting, which are important factors in areas heavily infested with cotton-boll weevils. In general, K fertilizers give increased yields. N promotes growth and also increases fruiting. Well-nourished plants will often mature earlier and be more fruitful than nutritionally deficient plants. C. R. Fellers

Effects of fertilizer treatments on the keeping qualities of Cox's orange pippin apples. F. Kidd and C. West. *Dept. Sci. Ind. Research* (Brit.), *Food Invest. Board* **1938**, 143–8(1939); cf. *C. A.* **33**, 2516.—Land receiving 8 different fertilizer treatments showed the best-flavored fruit was produced by complete fertilizer treatment (N-P-K). J. S. Hicks

Effect of potash fertilizers on the resistance of perennial grasses during winter. A. Chepikova. *Chemisation Socialistic Agr.* **7**, No. 10, 76–8(1938); *Chimie & industrie* **42**, 725–6.—K fertilizers help increase the resistance of perennial grasses to low temps. They increase the water-retention power of hydrophylic colloids (measured by swelling), raise the viscosity of the cellular fluids and produce an increased accumulation of colloids before the hibernating period. A. Papineau-Couture

Effect of successive applications of different forms of potash fertilizers on potato and beet crops and on soil properties. R. I. Pevzner. *Chemisation Socialistic Agr.* **7**, No. 10, 53–8(1938); *Chimie & industrie* **42**, 726.—Results are presented of tests carried out for 4 yrs. on heavy clayey soils. The best form of K fertilizer is K_2SO_4 which gives max. yields of tuber and max. starch yield. Sylvanite and carnallite are the least advantageous fertilizers for potatoes; on the other hand, they give excellent results with fodder beets, better than KCl or K_2SO_4. In both cases the 40% K salts occupy an intermediate position. A. Papineau-Couture

Investigations and patents on trace elements in fertilizers. I. Bruno Waeser. *Kolloid-Z.* **90**, 251–6(1940).—A review. G. G.

Continuous apparatus for manufacturing superphosphate. Measurement of phosphate and acid. Mixing. J. Moritz. *Atti X° congr. intern. chim.* **4**, 30–40(1939).—The scales, weighing machines, poidometers and rotary cell feeders are described and shown. The const temp.-const. concn. acid is fed by controllable valve, feed meter, acid-measuring bottle, or dipper cup feeder. Continuous mixers are used. E. M. Symmes

The mechanism of destruction of the eggs of Chilo simplex Butler by nicotine sulfate. II. The relation of the evaporation of nicotine sulfate to its ovicidal power. Kaduhusa Misaka. *J. Imp. Agr. Expt. Sta. Japan* **3**, 239–74(1938)(in German with Japanese summary); cf. *C. A.* **27**, 2752.—In lab. expts. a current of moist air was passed over eggs of *C. simplex* varying in age from 1 to 5 days, after they had been brushed with nicotine sulfate soln. Vaporization of the nicotine was regulated by the addn. of varying amts. of H_2SO_4 to the soln., the nicotine concn. being 0.032% and the pH of the solns. varying from 2.12 to 7.74. The eggs were not killed by suffocation but were poisoned by the nicotine vapor from the soln. If the soln. was alk. so that the nicotine evapd. quickly, it killed the older eggs but not the younger ones. But if the soln. was acid so that the nicotine evapd.

slowly, the small quantity of vapor was insufficient to kill the old eggs, but killed or retarded the development of many young eggs because they were exposed to the gradually evapg. nicotine during development. Thus no nicotine sulfate soln. alone can kill eggs of all ages. In further expts., wetting agents were tested better to control nicotine evapn., and since alk. wetters were obviously unsatisfactory, tests were made with colloidal substances which limit evapn. by forming a thin layer. Addn. of 5% glycerol or 1% glue to 0.05% nicotine solns. improved the toxicity of the solns., but the most effective ones against eggs of all ages were those contg. 1% gum arabic, which gave 100% control. Physiol. observations indicate that nicotine acts on the nervous system and therefore that sensitivity to it increases with increased embryonic development. 36 references. E. J. S.

Report of provincial plant pathologist. J. W. Eastham. *Ann. Rept. Brit. Columbia Dept. Agr.* **1937**, 43–51(1938). —Cracking of *cherries* was considerably reduced by spraying the fruit with Bordeaux mixt. 2–3–40 about 5 weeks before picking (cf. Foster, *C. A.* **32**, 2277[8]). Methods for control of *snapdragon rust* were worked out (cf. Foster, *C. A.* **32**, 9378[6]). Data from expts. on *soil sterilization* and its effect on growth of tomato seedlings were tabulated. Steam sterilization of peat and loam together reduced growth. Application of $NaNO_3$, superphosphate, K_2SO_4, $(NH_4)_3PO_4$, phosphate + potash, before or after steam sterilization with peat added after, produced seedlings of approx. the same wt. $(NH_4)_2SO_4$, KCl (slightly) and a complete fertilizer with peat applied after steam sterilization improved seedling growth. Best growth was obtained by superphosphate and phosphate + potash before or after steaming with peat applied after, and complete fertilizer and peat applied after. Manure applied before or after steam sterilization of the soil, with fertilizers (except K_2SO_4) applied before or after, did not affect growth much. K_2SO_4 with manure applied after steaming improved growth. *Ibid.* **1938**, 42–8(1939).—Results of 2 yrs.' expts. on application of B as borax or boric acid to control *drought-spot* and *corky core* of apples and pears (B-deficiency diseases) do not show an appreciably increased percentage of disease-free fruit; this indicates that B may not be the limiting factor under coast conditions. Further tests are necessary to det. whether the trees are getting the B. Expts. during 1936–38 showed that both Bouisol at 5 lb./100 gal. H_2O and Bordeaux mixt. 4–4–40, applied at pink, calyx and 3 weeks after, were equally as satisfactory for control of *pear scab* as the standard lime S 1–40 gal. H_2O.

Edwin J. Seiferle

Direct capture of the larvae of Cydia pomonella L. Francesco Dotti. *Riv. frutticultura* **2**, 101–16(1938) (French, English and German summaries).—Field expts. in 1934–37 in Italy showed that the application of a single β-naphthol band per tree gave roughly the same nos. of captured larvae of *C.* [*Carpocapsa*] *pomonella* as were obtained by several bands. Bands treated with β-naphthol captured many more larvae than those without β-naphthol; in 1 expt. 55 larvae per tree with treated bands against 20 with untreated bands. Use of these bands has resulted in almost 50% less infested fruit in the same year of application, 5.75% against 9.66%, and further in a progressive decrease in no. of larvae captured, and hence in no. of larvae present, after application of the bands for several consecutive years. β-Naphthol bands were ineffective in capturing *Cydia molesta* Busch on peach trees, but were very efficacious against *C. pomonella putaminana* Stgr. on walnut trees. E. J. Seiferle

Value and defects of Bordeaux mixture and calcium polysulfides used on apple trees. Francesco Dotti. *Riv. frutticultura* **1**, 197–224(1937).—In field expts. against *Venturia inaequalis*, apple scab, lime-S and Bordeaux mixt. gave equally good results in 5 tests on certain varieties of apple; in 6 tests lime-S gave good results but poorer than those given by Bordeaux; in 1 test lime-S gave results considerably poorer than those given by Bordeaux; and in 6 other tests on 2 varieties lime-S gave neg. results while Bordeaux gave satisfactory results. Both fungicides were tested at 1 to 1.5% concns. and 5 applications were made in each test. Edwin J. Seiferle

Report of horticultural branch. W. H. Robertson. *Ann. Rept. Brit. Columbia Dept. Agr.* **1937**, 24–43 (1938).—In 3 yrs.' expts. in control of *anthracnose* on apples, Bordeaux mixt. was slightly more effective than Bouisol at 4.5 pints/100 gal. H_2O; the latter, however, gave fairly good control at this rate, and was less effective as the rate was decreased to 3 and 1.5 pints/100 gal. H_2O. In expts. in 1937 the no. of anthracnose lesions on 25 twigs per tree sprayed with Bordeaux was 3–10% of that on unsprayed trees. In expts. for control of *apple scab*, an unsprayed tree showed only 38% scab-free fruit, while 85–98% scab-free fruit was obtained by use of the spray schedules consisting of a prepink spray of 1–35 lime-S, and (1) calyx 1–60 lime-S, cover 1–60 lime-S + Ca arsenate 4 lb. to 80 gal. H_2O, giving light leaf-spot burn after calyx spray; (2) calyx and cover, 1–60 lime-S + 3 lb. Pb arsenate/80 gal. H_2O; (3) calyx and cover, micronized S 5 lb./100 gal. H_2O + 4 lb. Ca arsenate/80 gal. H_2O, giving no spray injury; (4) same as (3) but with 3 lb. Pb arsenate instead of Ca arsenate; (5) calyx and cover, lime-S 1–100 + Kolofog 6 lb., hydrated lime 8 lb. and Ca arsenate 4 lb./80 gal. H_2O. Treatments consisting of a prepink spray of 1–35 lime-S and calyx and cover sprays of 1–400 or 1–500 cosmic S gave only 55–58% scab-free apples. An addnl., later spray of 1–500 cosmic S to the former raised the scab-free percentage to 70, and a late spray of 5 lb. micronized S/100 gal. H_2O + 3 lb. Pb arsenate/80 gal. H_2O after the latter increased the scab-free apples to 86%. Field expts. against the codling moth, *Carpocapsa pomonella*, on apple, showed that Pb arsenate at 8 lb./240 gal. H_2O + 2.5 quarts fish-oil with 5% oleic acid added gave the best control on 3 varieties tested. Pb arsenate at the same rate + 0.5 lb. Fluxit gave good control on McIntosh apples and fair control on Jonathan and Stayman, poorer on Newtown. Colloidal Pb arsenate at 5 pints/240 gal. H_2O and Ca arsenate at 12 lb./240 gal. H_2O + 0.75 lb. $ZnSO_4$ + 0.75 lb. lime + 3 oz. blood albumin gave good control on McIntosh, Jonathan and Stayman apples, poorer on Newtown. Phenothiazine at 5 lb./240 gal. H_2O gave fair control on Jonathan and Stayman, poorer on McIntosh and poor on Newtown. It was shown that 2 cover sprays do not afford sufficient protection. Expts. against the mealy bug [*Pseudococcus* sp.] indicated that a 6% dormant oil spray gave fairly satisfactory control of this pest on apples. *Ibid.* **1938**, 27–42(1939).—In apple scab control expts. some edge-burn and stunting of the foliage were observed after the prepink spray with lime-S, but none was observed in neutral S plots. In a plot sprayed with a mixt. of lime-S 1–60 and Ca arsenate 4 lb./100 gal. H_2O, scabby apples were 0.02% of the total as compared with 84.2% in a check tree. In expts. to control the codling moth, *Carpocapsa pomonella*, on apple, Black Leaf 155 and phenothiazine were equal if not slightly superior to Pb arsenate, but were more costly to spray. In expts. to control the European red mite, *Paratetranychus pilosus*, on apples of variety Yellow Newtown, 1% Elgetol and sol. S at 10 lb./50 gal. H_2O were applied as delayed dormant sprays. Elgetol was of no value while sol. S gave fair control. As summer sprays, 1% home-mixed and com. oils of viscosity 70–75 sec. and sulfonation 90, 10% home-mixed oil + Na_3AlF_6, cosmic S 1–200, and Stantex oil + Rotox 1–100 gave good control of severe infestations. Santobane 100 gave severe burning at the strength used. When H_2O alone was sprayed excellent control was obtained. No explanation for this fact is offered, but the work will be repeated. Expts. against the mealy bug [*Pseudococcus* sp.] showed that good control was obtained by dormant sprays consisting of Oliver's oil, 4% actual oil + lime-S 1–15, or 1% Elgetol (by wt.). Slightly poorer control was given by dormant sprays of Oliver's oil, 6% actual oil, or 1% Stantex dispersing oil + 0.5 pint 5% rotenone ext. and 2 lb. Lux soap flakes/100 gal. H_2O. All vols. are given in Brit. measure.

Edwin J. Seiferle

Resistance of the apple to fungal invasion. A. S.

Horne and W. A. Roach. *Dept. Sci. Ind. Research* (Brit), *Rept. Food Invest. Board* **1938**, 173–83(1939).—Exptl. results indicate higher internal resistance of fruit from Ulster than that from localities in Kent. Resistance in relation to injection of apple trees with solns. contg. phosphate, K, N and other chemicals was studied and showed no very definite effect. J. S. Hicks

Additional experience with the apple and pear sawflies (Hoplocampa testudinea Klg. & H. brevis Klg.). H. Velbinger. *Nachbl. deut. Pflanzenschutzdienst* 20, 3–5 (1940); cf. *C. A.* **34**, 1437[7].—Sprays contg. quassia and CuO applied 2–3 days after petal fall controlled the sawflies as evidenced by the marked reduction in subsequent fruit fall. Pear trees sprayed with a spray contg. 3% quassia + 1% CuO showed a 3.1% fruit fall as compared with a 34.1% for the controls. Apple trees sprayed, resp., with 0.1% quassia + 0.75% CuO and 1.2% quassia + 0.4% CuO gave reductions in fruit fall from 18.3% to 1.6% and 32.5% to 6.4%. Vernon L. Frampton

Borax for the control of internal black spot of beets. J. C. Walker. *Canner* 90, No. 15, 31(1940); cf. *C. A.* **34**, 211[6].—B deficiency in certain Wis. soils is the cause of black spot in beets. This injury is worse after a drought followed by wet weather with rapid growth. The defect is corrected by the addn. to the soil of 50 lb. of borax per acre. If the borax is applied as a ribbon or band not closer than 1½ in. from the seed, no injury results. C. R. Fellers

Relation of root reserves to control of European bindweed, Convolvulus arvensis L. A. L. Bakke, W. G. Gaessler and W. E. Loomis. *Iowa Agr. Expt. Sta., Research Bull.* **254**, 115–44(1939); cf. *C. A.* **32**, 2278[6].—The reserves of the bindweed roots are largely sucrose and dextrin-like compds. Reducing sugars and true starch played less important roles. Acid-hydrolyzable substances were not depleted by starving bindweed roots. Polysaccharide reserves were rapidly depleted in the surface roots with either fallowing or $NaClO_3$ treatments. Max. reserves were found in roots 6–8 ft. deep and these were exhausted only after prolonged fallowing. Chlorate treatments resulted in immediate lowering in root reserves. Total N, which does not decrease with respiration, showed a drop in the fallowed plots which paralleled the drop in carbohydrates but showed an increase in the chlorate-treated roots during the 1st season of treatment. Diurnal changes in the leaves, stems and roots of bindweed plants showed sucrose and the dextrin-like compds. to be important carbohydrates of all tissues, both as regards total quantities and diurnal fluctuations. On the basis of analyses of total tissues, the gradients of all of the substances assumed to be available for translocation were neg. in every detn., being lowest in the leaves, intermediate in the stems and highest in the roots. **Control of European bindweed, Convolvulus arvensis L.** A. L. Bakke. *Ibid.* **259**, 367–440(1939).—$NaClO_3$ was the most effective herbicide studied. A concn. of 1 lb. per gal. with 4 g. powd. glue and 3 cc. of concd. H_2SO_4 is the recommended formula. Climatic conditions have much to do with the effectiveness of sprays. Three successive applications of either $NaClO_3$ or the com. prepn. Atlacide gave complete eradication in 1 season. Spraying should be done when there is a heavy development of leaf surface. NaCl was of very limited value in bindweed eradication. Similarly borax, $FeSO_4$, $ZnSO_4$, kainite and $Ca(ClO_3)_2$ were of little herbicidal value. $KClO_3$ was equally as effective as $NaClO_3$. Soybeans are particularly sensitive as a follow-up crop on soil treated with $NaClO_3$ and should not be planted the 1st season following treatment. Corn is not so sensitive as wheat, oats or barley. Alfalfa is very tolerant to traces of the herbicide left in the soil and can be sown soon after treatment. C. R. Fellers

Insects of the blackberry, raspberry, strawberry, currant and gooseberry. A. J. Hanson and R. L. Webster. *Wash. Agr. Expt. Sta. Popular Bull.* No. 155, 38 pp.(1938).—A résumé of the pests and methods for their control. B. C. P. A.

Control of the cabbage fly on the west coast of Schleswig-Holstein. E. Riggert and H. Goffart. *Z. Pflanzenkrankh. Pflanzenschutz* **47**, 394–401(1937).—Comparative trials with aq. $HgCl_2$, $C_{10}H_8$ and carbolineum are recorded. B. C. P. A.

Factors affecting the recovery of hydrocyanic acid from fumigated citrus tissues. E. T. Bartholomew, Walton B. Sinclair and Byron E. Janes. *Hilgardia* **12**, 473–95 (1939); cf. *C. A.* **30**, 4195[1].—Citrus tissues do not contain autogenous HCN. A modified Liebig $AgNO_3$ volumetric method was employed for the detn. of HCN, the end point of titration being detd. by the use of a photoelec. turbidimeter (*C. A.* **30**, 7061[8]). Details of the method required to obtain the HCN from citrus tissue are given. As little as 10–15 mg. of HCN was recovered and estd. H_2S from the fumigated citrus leaves and fruits passed into the distillate and interfered with the detns. of HCN with standard $AgNO_3$. This trouble was overcome by placing $CdSO_4$ in the distn. flask at the time of making the 1st or 2nd distn. Tissues of citrus leaves or fruits are already acid; so only a small amt. of concd. H_2SO_4 had to be added to ensure the recovery of HCN during distn. No destruction of the HCN occurred as a result of using small amts. of H_2SO_4. Results show that citrus leaves and fruits fix or alter a portion of the HCN during fumigation so that it cannot be recovered by distn. From 73 to 85% of the HCN could be recovered from the leaves. HCN penetrates the leaf tissue and does not merely adhere to the surface. The amts. of HCN recovered were directly proportional to the amts. placed in the fumatorium. In a 40-min. fumigation green fruit contained 10–14 times as much HCN as there was in an equal vol. of air in the fumatorium. C. R. F.

Fourth annual report of the coffee research and experimental station, Lyamungu, Moshi, 1937; Report of the agricultural officer. F. R. Sanders. *Dept. Agr. Tanganyika Terr. Pamphlet* No. 22, 41(1938).—Spraying with nicotine sulfate failed to give control of the leaf miner [*Leucoptera*] injuring coffee, when applied in Jan. or Feb., but was effective against pupae on the lower surface of the leaf. **Report of entomologist.** F. B. Notley. *Ibid.* 51–2.—Sprays of Derrisol in H_2O or Bordeaux mixt. (1:500) were effective against the thrips [*Diarthrothrips coffeae* Will.] on coffee. Baits of maize flour and Paris green (1:50) gave 90.9 to 98.5% mortality of the beetle, *Dasus* (*Gonocephalum*) *simplex* F. Through *Rev. Applied Entomol.* **27A**, 126–7(1939). Edwin J. Seiferle

The use of oil or oil containing pyrethrins for earworm [Heliothis armigera Hbn.] control in sweet corn. Geo W. Barber. *U. S. Dept. Agr., Bur. Entomol. Plant Quarantine* **E-497**, 9 pp.(Feb., 1940); cf. *C. A.* **33**, 8898[1].—White mineral oil (150–250 Saybolt viscosity at 100°F.) contg. 0.05% pyrethrins was nearly as effective as that contg. larger amts. of pyrethrins. Oil contg. 0.2% pyrethrins gives reasonably satisfactory control under usual conditions. Oil should not be applied to the ears before about the 3rd day after silk exposure. Oil contg. pyrethrins can be applied efficiently several days later than is satisfactory for oils alone. The application should be 0.75–1.0 cc. per ear. An improved oiler for applying the larvicide is described and figured. K. D. Jacob

[Report of] entomological section. H. K. Sen. *Indian Lac Research Inst. Ann. Rept.* **1937–38**, 16–26(1938).—Expts. were made on control of the coccid, *Aspidiotus orientalis*, a major pest of the host trees of lac, *Laccifer lacca*. A lime-S spray gave only 30% mortality after 10 days and less than 100% in 4 weeks. A spray of waste motor car oil gave 100% kill in 10 days but the trees were so badly burned that the oil was abandoned. A spray of a completely refined, low-boiling paraffin distillate (closely allied to kerosene) produced 91% mortality in 10 days and 100% in 3 weeks, with no damage to the trees. Fumigation of termitaria with com. prepns. showed that gasoline was most effective in termite control. E. J. S.

New winter sprays for combating Lygus spinolae in Styria (spring 1938). L. Fulmek. *Neuheiten Gebiet Pflanzenschutz* **31**, 151–6(1938); *Rev. Applied Entomol.* **27A**, 45(1939); cf. Speyer, *C. A.* **30**, 8498[8]; Tomaszewski and Fischer, *C. A.* **30**, 8498[8].—Eight proprietary

sprays were tested against *L. spinolae* Meyer on grape vines, by application in March before new growth began. A tree spray at 8 and 7% gave 82.18 and 79.73% control, resp., and a normal fruit tree carbolineum with a relatively high mineral oil content at 6% gave 78.96% control, but caused some injury to the stocks during frost. Two prepns. of org. dyes contg. dinitrocresol gave 69.54 and 69.41% control. During subsequent frosty weather vines sprayed with mineral oil emulsions suffered most, so these insecticides must be rejected in spite of the good control results obtained with them. E. J. Seiferle

White grubs in lawns and golf courses. Clyde C. Hamilton. *New Jersey Agr. Expt. Sta., Circ.* **394**, 1–4 (1939).—The grubs are those of the Japanese beetle (*Popillia japonica* Newm.), the Asiatic garden beetle (*Autoserica castanea* Arrow), the Oriental beetle (*Anomala orientalis* Waterh.) and a native June beetle (*Ochrosidia villosa* Burm.). The best chem. treatment consists of applying powd. Pb arsenate at the rate of 10 lb. for each 1000 sq. ft. of surface. In order to secure an even mixt. 1 part of Pb arsenate is mixed with 3 parts of sand, soil or fertilizer at the time of application. The best seasons to apply the Pb arsenate are early spring and early fall. C. R. Fellers

Occurrence and spread of the ring spot disease of lettuce caused by Marssonina panattoniana. G. B. Stevenson. *J. Pomology* **17**, 27–50(1939).—In seedling crops the disease is checked by spraying with Bordeaux mixt. (3.6:50). Seed can be disinfected by dipping (4–6 hrs.) in aq. $CaOCl_2$ (1:10). B. C. P. A.

Report of field crops branch. Cecil Tice. *Ann. Rept. Brit. Columbia Dept. Agr.* **1938**, 61–7(1939).—Field work on weed control showed that $NaClO_3$ gave good control of morning glory, *Convolvulus arvensis*, and Canada thistle, *Carsium arvense;* variable control, in one case, of couch grass, *Agropyron repens;* and poor results on hoary pepper grass, *Lepidium draba*. Further tests against *A. repens* showed that spraying at 2 lb. $NaClO_3$/gal. H_2O gave satisfactory kill, but that mixing with sand or dry soil and broadcasting at 180 lb./acre gave no control. Activated CS_2 gave poor control of *L. draba* and $CaCN_2$ was unsatisfactory against wild mustard. Edwin J. Seiferle

Series of experiments with substances attractive to the olive fly. G. Bua. *L'Olivicoltore* **15**, 19 pp.(1938)(reprint); *Rev. Applied Entomol.* **27A**, 98(1939); cf. *Ann. ist. super. agrar. Portici* (3) **6**, 125–45(1933)(Pub. 1934); *Rev. Applied Entomol.* **22A**, 365(1934).—Expts. carried out in 1934 and 1935 in Italy on attractants for the olive fly, *Dacus oleae* Gmel., are described. In 1934, the pans were baited with NH_4 salts, several types of com. molasses prepns. called Dachicida and Dacivoro, combinations of these and NH_4 salts, Clensel, cinnamon oil and infusions of bran and of dried figs, both with the addn. of borax. The most attractive of these was a 10% diln. of Dachicida P, a new prepn. of molasses contg. 2.5% Na arsenite, 3.5% H_2O, 1% olive oil and 0.5% $(NH_4)_2SO_4$. It lost its attractiveness, however, in a few days. Dachicida P was tested only in the fall, and in late spring and summer 5 or 10% dilns. of NH_4NO_3 were more attractive than any other baits. Clensel also showed good attractive power at 3.3% and was 2nd in efficiency in the fall. In the late spring and summer of 1935, highest catches were obtained with baits of 3% dilns. of NH_4NO_3 or $(NH_4)_2HPO_4$, while Dachicida P was not even best of the molasses baits; but in the fall Dachicida P gave the highest catches. The variations given by the molasses prepns. are attributed to variations in compn. Their inferiority to NH_4 salts in summer was due to fermentation at high temps., since Dachicida P retained its attractiveness longer if borax or $KHSO_4$ was added. These baits also catch the olive moth, *Prays oleellus* F. Edwin J. Seiferle

Experiments against Cydia molesta by means of oil-sulfur-lime dusts. M. Mariani, G. Goia and C. Gerbaldi. *Riv. frutticultura* **2**, 145–51(1938)(French, English and German summaries).—In field tests against *C. molesta* Busk. on peach trees, good control was obtained by use of a dust contg. 60 parts S, 35 parts hydrated lime and 5 parts summer oil, applied 7 times at rates from 0.147 to 0.352 kg. per tree. This control method was equally as satisfactory as the method of cutting off the infested shoots, but was more expensive. Edwin J. Seiferle

Infusion of quassia in work against Hoplocampa on plums. Francesco Dotti. *Riv. frutticultura* **1**, 59–88 (1937); *Rev. Applied Entomol.* **27A**, 97–8(1939); cf. following abstr.—Expts. were made in northern Italy to compare the value against the plum sawflies, *H. minuta* Christ and *H. flava* L., of 1.5 or 2% quassia infusions (obtained by soaking the chips in water for 48 hrs. and straining) with 0.3 or 0.4% Pb arsenate. Applications were made about Mar. 23 at full blossom, Mar. 31 at petal fall, and 18 days later at calyx fall. Av. percentages of infestation of fruits were 1.76 in trees sprayed with quassia, 5.54 in those sprayed with Pb arsenate, and 13.16 in unsprayed controls. The stronger quassia spray appeared only slightly more effective than the weaker. Quassia was equally effective against the aphid, *Hyalopterus arundinis* F., but was inferior to Pb arsenate against *Hipponomeuta padellus* L. It did not scorch the leaves or poison bees. Edwin J. Seiferle

Further research on the insecticidal value of infusions of quassia. Francesco Dotti. *Riv. frutticultura* **2**, 29–33 (1938); cf. preceding abstr.—A 2% quassia infusion applied to pear trees at the time of full blossom and again at petal fall allowed infestation of 3.35% of the fruit by *Hoplocampa brevis* Kl., as against 31.56% infestation in untreated trees. A similar infusion was applied to apple trees on April 18, May 29, June 11 and 23 and July 14 and was compared with Pb arsenate used at 0.3% in the 1st application, 0.5% in the 2nd to 4th and 0.6% in the last application. In untreated controls infestation by *Cydia* [*Carpocapsa*] *pomonella* was 11.2%, in trees treated with quassia 4.9%, in trees treated with Pb arsenate 2% and in trees treated with the 2 insecticides together 1.7%. Quassia is therefore inferior to Pb arsenate against *C. pomonella*. Edwin J. Seiferle

[Control of wireworms.] H. W. Miles and M. Cohen. *J. Roy. Lancashire Agr. Soc.* **1938**, 31 pp.(reprint); *Rev. Applied Entomol.* **27A**, 97(1939).—In expts. in 1937, $C_{10}H_8$ had no effect on foliage, vigor or yield of potatoes when applied at 300 lb./acre before the land was ridged up, but did not appreciably reduce injury by wireworms. Growth was also unaffected by dressings of 150–600 lb./acre applied in the drills so that the sets were in contact with it. The percentage germination of wheat seed planted in Oct. was very severely reduced by mixing it with $C_{10}H_8$ at 16 lb./bushel and less markedly with superphosphate at 32 lb. or more per bushel. After a week, 4% of the untreated seedlings were destroyed by wireworms, whereas less than 1% of those treated were injured. Edwin J. Seiferle

Prickly pear eradication and control. W. H. Dameron and H. P. Smith. *Texas Agr. Expt. Sta., Bull.* **575**, 5–55 (1939).—Prickly pears (*Opuntia* spp.) on cattle and sheep ranges are best eliminated by treatment with an arsenical. A satisfactory formula consists of 3 lb. As_2O_3 (96–98% pure) to 1 gal. of water to which 1 pint of conc. H_2SO_4 is added. Both sides of the slabs should be well sprayed with a mist of this poison by using 110–120 lb. air pressure. Spraying during the hot summer months gives best results. A metal alloy of 18% Cr, 8% Ni and not over 0.07% C, generally termed 18-8-S stainless steel, showed practically no corrosion after a 31-day test when the metal was partly immersed in the prickly pear poison. This alloy is suitable for the construction of the atomizer tanks. C. R. F.

Root aphids and ants as pests of rubber-producing plants. M. S. Gilyarov. *Pests and Diseases of Rubber-bearing Plants* (Moscow) **2**, 49–67(1938)(in Russian with English summary); *Rev. Applied Entomol.* **27A**, 43–4 (1939).—Soil fumigation with chloropicrin in plantations of *Scorzonera tau-saghyz* gave complete mortality of the green root aphid, *Xerophilaphis scorzonerae* Morav. only when the dosage was 1.2 oz./sq. yd., which injured the plants. Applications of Paris green round the entrance holes to the nests of *Lasius* at the rate of 1 teaspoonful per hole caused desertion of 70% of the ant hills in one plot and 94.8% in another. This method as well as the use

of poisoned honey-baits and fumigation of the nests with chloropicrin or SO_2 was ineffective against large ants of the genus *Formica*. Edwin J. Seiferle

Control of the strawberry blossom weevil. O. Jancke. *Obst. u. Gemüsebau* **84**, 53–4(1938); *Rev. Applied Entomol.* **27A**, 155(1939).—Tests with several com. insecticidal dusts in 1937 against *Anthonomus rubi* Hbst. showed that the best (88%) control was given by a single application of derris dust, which was more effective than pyrethrum dust alone or mixts of pyrethrum and derris. E. J. S. 2

Sweet-potato leaf beetle. L. W. Brannon. *U. S. Dept. Agr., Circ.* No. **495**, 9 pp.(1938).—In tests with caged insects 80% $BaSiF_6$-infusorial earth (1:2), synthetic cryolite-talc (3:2) or undiluted Ca arsenate gave a high percentage kill of adult insects. B. C. P. A.

Controlling tobacco downy mildew (blue mold) with *p*-dichlorobenzene. W. B. Tisdale and Randall R. Kincaid. *Florida Agr. Expt. Sta., Bull.* **342**, 16 pp.(1939).—The vapor from *p*-dichlorobenzene crystals suspended above the seedling beds but not more than 3 ft. from the plants effectively controls downy mildew in tobacco. From 2 to 3 lb. per night for 3 nights for 100 sq. yards of bed is recommended. The crystals are thinly distributed on a cloth screen stretched above the plants. The life of the cloth can be greatly increased by soaking it in a soln. made up of 4 lb. $ZnSO_4$, 4 lb. Na_2SO_4, 1 lb. tartaric acid and 150 gals. of water. C. R. Fellers 3 4

Control of seedling injury and root rot of tobacco in seed beds by chemical means. K. Böning. *Z. Pflanzenkrankh. Pflanzenschutz* **45**, 385–415(1935).—Control measures include treatment of soil with $CaCN_2$, CH_2O, Ceresan or Bordeaux mixt. and subsequent spraying of seedlings with Cu prepns. B. C. P. A.

Control of tomato leaf-mold. The value of different sprays. K. M. Curtis. *New Zealand J. Sci. Tech.* **21A**, 187–92(1939); cf. *C. A.* **31**, 8803².—Control of the fungus (*Cladosporium fulvum*) was satisfactory with either Shirlan A. G. or Shirlan W. S. (H_2O-sol.) used at the rates of 3 lb. per 100 gal. spray mixt. Applications of Shirlan W. S. with a power spray produced some damage to leaves. Considering crop yield, quality of fruit, earliness of yield, noninjury to blossom or leafage and cost of sprays, the 2 Shirlan sprays were more satisfactory than those made from either Cu_2O and oil, $CuSO_4$ and soap soln., Bouisol and soap soln., Bouisol and oil, malachite green and amyl alc., Bordeaux and oil, $KMnO_4$ or bleaching powder. John O. Hardesty 5 6

Control of the wheat midge by cultivation and fertilization. H. Klee and B. Rademacher. *Z. Pflanzenkrankh. Pflanzenschutz* **47**, 232–50(1937).—Treatment with kainite, CaO or $CaCN_2$ destroyed the majority of larvae of *Contarinia tritici* and *Silodiplosis mosellana* in soil. Kainite + $CaCN_2$ (2:1) gave still better results. B. C. P. A. 7

Controlling seed-borne stinking smut of wheat by disinfectants. Roderick Sprague. *Oregon Agr. Expt. Sta., Bull.* **363**, 5–33(1939).—New Improved Ceresan, a new Hg fungicide at the rate of 14 22 g. per bu. or 50% basic Cu carbonate at the rate of 85 g. a bu. for winter wheat or 57 g. per bu. for spring wheat, will effectively free the seed from smut (*Tilletia tritici* or *T. levis*). Conditions are more favorable for smut development in late fall plantings and under these conditions seed treatments are less effective. C. R. Fellers 8

Toxicity of ethylene oxide to Calandra oryzae, C. granaria, Tribolium castaneum and Cimex lectularis. J. R. Bosvine. *Ann. Applied Biol.* **25**, 605–32(1938).—The technique of toxicity detns. and the influence of physiol. factors on the percentage kill of insects are examd. The relative order of resistance to HCN, SO_2 and ethylene oxide varied with the species tested. B. C. P. A. 9

The modern chemical arsenal and what it means in the fight against insects. M. D. Leonard. *Pests* **8**, No. 3, 7–9(1940).—A review of insecticide problems. Henry H. Richardson 1

The necessity of regulating the use of hydrocyanic acid vapors in the destruction of animal parasites of vegetables, vegetable products and agricultural commodities. M. Vayssière. *Bull. office intern. hyg. publ.* **31**, 877–81(1939). —Disinfection with HCN is cheap, effective and harmless when proper precautions are taken. No HCN is retained by the substances treated (food, tobacco, etc.). Ruth Berggren

Decomposition of copper-lime [fungicidal] complexes. P. Reckendorfer. *Z. Pflanzenkrankh. Pflanzenschutz* **46**, 418–38(1936).—Decompn. of Bordeaux-mixt. residues on sprayed foliage with production of sol. Cu compds. requires the presence of CO_2 and H_2O. The end products are probably $CuSO_4$ and $Cu(HCO_3)_2$. Under lab. conditions complete conversion of Cu into sol. forms may occur in about 45 days. The maintenance of toxic Cu-ion concn. on sprayed foliage under field conditions is examd. B. C. P. A.

Expts. with B on cereals (Schropp, Arenz) **11D.** Action of B on carrots, sunflowers and buckwheat (Schropp, Arenz) **11D.** Influence of B with various K-N ratios on growth of field beans (Arenz, Schropp) **11D.** Incorporation of growth hormones in seed dressings (Croxall, Oglivie) **11D.** Production and use of *Hevea* oilcake [as fertilizer] (Le Bras) **12.** Prized wines of Verona Province [analyses of soils] (Dalmasso, *et al.*) **16.** $(NH_4)_2C_2O_4$ for use as fertilizer (Uno) **18.**

Kaserer, Hermann: Der Kunstdünger. Kurzgefasste Beschreibung der künstlichen Düngemittel nebst Anleitung fur Ankauf und Verwendung derselben und einem Anhang über die Düngung der einzelnen Kulturpflanzen. 5th ed. Vienna: Scholle-Verlag. 64 pp. M. 150.

Lüstner, Gustav: Krankheiten und Feinde der Obstbäume, Beerensträucher und des Strauch- und Schalenobstes. Ein Wegweiser für ihre Erkennung und Bekämpfung. 4th ed. Stuttgart: Ulmer. 187 pp. M. 3.

Vigneron, H.: L'industrie chimique des engrais. Paris: Masson et Cie. 280 pp. Fr. 60.

Spraying plants to prevent freezing. Oliver P. Greenstreet and Thomas C. Hall. U. S. 2,185,663, Jan. 2. For spraying plants such as those of fruit orchards, use is made of an emulsion contg. petroleum oil and water and an alc. (suitably also contg. glycerol, honey and blood albumin). 6

Fertilizer. S. S. Dragunov, D. V. Zaikin and Yu. N. Bezobrazov. Russ. 52,305, Dec. 31, 1937. Comminuted peat is impregnated with tar water from the dry distn. of peat, coal, etc., treated with NH_3 and dried.

Fertilizer. A. Ya. Zvorykin. Russ. 55,840, Oct. 31, 1939. Polyhalite is freed of NaCl, treated with dil. H_3PO_4, satd. with NH_4 salts, freed of gypsum and evapd. to dryness.

Fertilizers. A. Ya. Zvorykin. Russ. 56,095, Nov. 30, 1939. Solns. contg. 35–6% ammonium phosphate are treated with a 2–18% soln. of KCl at temps. of −5 to +65°.

Phosphatic fertilizers. Röchling'sche Eisen- und Stahlwerke G. m. b. H. Brit. 508,830, July 6, 1939. Addn. to 461,869 (*C. A.* **31**, 5503⁸). Mineral phosphate is melted in a hearth furnace, e. g., an intermittently or continuously operated rotary furnace, together with the soda slag obtained in the treatment of pig Fe according to 461,869, the furnace lining consisting of a mixt. of burnt dolomite or magnesite with tar or of bricks pressed from such mixt. Corrosion of the furnace lining is thus minimized. The products are citric acid- and citrate-sol.

Insecticide and fungicide. N. D. Pelikh and S. I. Lyukin. Russ. 52,159, Nov. 30, 1937. Ca trichloromethanesulfonate is specified.

Treating seeds. Ya. P. Berkman, B. A. Voloshinov and I. G. Gurdzhi. Russ. 55,849, Oct. 31, 1939. The seeds are treated with Mg, Fe or Zn salts of sulfonated crude anthracene, anthracene oil or heavy oil.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Effect of the quantity of yeast on the fermentation of cereal worts. A. Ashkenuzi. *Spirto-Vodochnaya Prom.* **16**, No. 2, 10–14(1939); *Chimie & industrie* **42**, 887.—Increasing the quantity of yeast above 2% accelerates fermentation during the 1st period of 24–36 hrs., but does not shorten total time of fermentation. In order that it may be possible to shorten the total time of fermentation, the fermenting liquid must contain only maltose, with possibly a small quantity of dextrin. A. P.-C.

Practical treatment of decomposed potatoes. I. Nemlikher. *Spirto-Vodochnaya Prom.* **15**, No. 9, 35(1938); *Chimie & industrie* **42**, 553.—By adding a certain amt. of chloride of lime (500 g. per t. of potatoes) to the saccharified wort obtained from deteriorated potatoes, the acidity of the wort is reduced and the alc. yield is considerably increased. A. Papineau-Couture

Fermentation of clear filtered grain and potato worts. A. Zabrodskiĭ and A. Movchan. *Spirto-Vodochnaya Prom.* **15**, No. 9, 12–18(1938); *Chimie & industrie* **42**, 553.—Clear filtered worts do not ferment as easily as unfiltered worts, irrespective of the nature of the raw material, degree of saccharification, acidity, concn., filtration temp. and duration of fermentation. The alc. yield is 0.5–1.5% lower with the filtered worts, fermentation takes place more slowly, and multiplication of the yeast is poor. It is the filtered corn and barley worts that ferment with greatest difficulty. A. Papineau-Couture

Determination of original wort content by the new [German] excise procedure. H. Bausch. *Wochschr. Brau.* **56**, 97–8(1939).—Either (*a*) the refractometer method or (*b*) the pycnometric-distn. process can be used. Method (*a*) involves detn. at 20° of d. and of the refraction in the Zeiss dipping refractometer, whence the original wort content can be read from a nomogram. If, in using this method, the result is found to be outside certain specified limits, varying for different classes of beer, the detn. is repeated, with method (*b*). B. C. P. A.

Continuous saccharification of wort in the brew kettle. V. Fremel and V. Lebedev. *Spirto-Vodochnaya Prom.* **15**, No. 10, 10–14(1938); *Chimie & industrie* **42**, 706.—Continuous saccharification in the brew kettle by uninterrupted introduction of cooked wort and malt suspension, with continuous removal of the saccharified wort, gives good results. There may, however, result an increased contamination of the wort, which may be avoided by heating the wort before saccharification for 15–20 min. at 61–2°. A. Papineau-Couture

Biochemical evaluation of barley for malting. V. Evteev, P. Danilenko, M. Eiber and A. Polojichnik. *Spirto-Vodochnaya Prom.* **15**, No. 10, 18–23(1938); *Chimie & industrie* **42**, 706–7.—Barley which has a high diastatic activity yields a malt with good saccharifying power; barley with low diastatic power gives a malt with rather poor saccharifying power. It is therefore rational to det. the diastatic power of barley to evaluate its suitability for malting. A. Papineau-Couture

Disinfection of fermentation tanks. K. Sotonin. *Spirto-Vodochnaya Prom.* **16**, No. 5, 24(1939); *Chimie & industrie* **42**, 888.—Good results are obtained with CH_2O or with chloride of lime. Introduce into the tank 100 cc. CH_2O on 200 g. chloride of lime per 100 hl. of capacity, close hermetically and steam. A. P.-C.

Effect of various defecating agents in the determination of sugar in intermediate distillery products. V. Semevskaya. *Spirto-Vodochnaya Prom.* **16**, No. 4, 36–9(1939); *Chimie & industrie* **42**, 888.—The best defecating agents for grain- or potato-worts are Herles' reagent (mixt. of a 340 g. per l. $Pb(NO_3)_2$ soln. and a 32 g. per l. NaOH soln.) and phosphotungstic acid (5% soln.); Herles' reagent only is suitable for molasses worts. A. Papineau-Couture

Methods of analysis of molasses used in the fermentation industries. W. A. Davis. *Research Labs., Distillers Co. Ltd., Epsom*, Separate 16 pp.; *Analyst* **64**, 517–18; cf. *C. A.* **32**, 6901[8].—The chief value of molasses from the point of view of the distiller is the quantity of EtOH that can be obtained from it. The methods used in testing it from this point of view are described in detail including a fermentation test which takes several days to carry out. 2 The detn. of fermentable sugars is made as described in a previous paper. Procedures for detg. the spirit yield and unfermentable sugars are also given. W. T. H.

Valuation of sulfuric acid recovered from acid tar in the manufacture of molasses alcohol. E. Kvasnikov and B. Reiser. *Spirto-Vodochnaya Prom.* **16**, No. 5, 20–2(1939); *Chimie & industrie* **42**, 888; cf. *C. A.* **33**, 4737[1].—The tests showed the possibility of substituting H_2SO_4 re- 3 covered from acid tar for the ordinary com. H_2SO_4 generally used in molasses distilleries. The regenerated acid can even be used in the manuf. of brandies and of liqueurs. A. Papineau-Couture

Use of antiseptics in alcoholic fermentation. L. Loginova. *Spirto-Vodochnaya Prom.* **16**, No. 3, 10–12 (1939); *Chimie & industrie* **42**, 888.—Under certain concn. conditions SO_2, salicylic acid and Na salicylate exert an inhibiting action on bacteria without affecting 4 the activity of yeasts. Other antiseptics tested (BzOH, BzONa, PhOH, malachite green, brilliant green) gave neg. results. A. Papineau-Couture

Controlling the rectification of alcohol. G. Fertman and A. Pokrovskiĭ. *Spirto-Vodochnaya Prom.* **16**, No. 3, 13–22(1939); *Chimie & industrie* **42**, 888.—Continuous automatic control of rectification, both in Barbet continuous stills and in Savalle batch stills, can be effected by means of recording manometric thermometers suitably 5 placed at different points of the app. A. P.-C.

Determination of petroleum products in crude and rectified alcohol. M. Kotlyarenko. *Spirto-Vodochnaya Prom.* **16**, No. 4, 33–4(1939); *Chimie & industrie* **42**, 888.—Petroleum products are first detected by their odor and taste, by treating the alc. on the one hand with $KMnO_4$ and on the other with activated charcoal. To det. them they are extd. with powd. activated charcoal, 6 the latter is distd., and the distillate is evaluated volumetrically or nephelometrically. A. P.-C.

The prized wines of the Verona Province. G. Dalmasso, I. Cosmo and G. Dell'Olio. *Annuar. stas. sper. viticolt. enol. Conegliano* **9**, appendix 1–197(1939).—The chemical analyses of 60 soils and 534 wines are tabulated. G. A. Bravo

Ebulliometric grade [alcohol content] of sweet wines. M. Procopio. *Ann. chim. applicata* **29**, 74–7(1939).— 7 The error due to the sugar content in the detn. of EtOH in sweet wines by Malligand's method is corrected by the use of a modified form of Emiliani's formula (cf. *C. A.* **33**, 8351[8]). B. C. P. A.

Bromine in the musts and wines. M. Venezia. *Annuar. staz. sper. viticolt. enol. Conegliano* **9**, 69–84(1939).—Of 84 samples of Italian musts and wines Br was found by the method of Chelle and Vitte (*Ann. fals.* **1936**, 98) in only 12 (0.005–0.06%). Br is not to be considered a 8 normal constituent of the wines, but it may be found in the products obtained from grapes cultivated in soils near to the sea, or fertilized with K salts. When Br content is greater than 0.001 g. per l., there is a suspicion of treatment with a Br-contg. antiseptic (e. g., $CH_2BrCOOH$). G. A. Bravo

Use of methyl orange as indicator for the determination of the alkalinity of brandies. A. Antonov. *Spirto-Vodochnaya Prom.* **16**, No. 1, 39(1939); *Chimie & industrie* **42**, 706.—Methyl orange is not suitable for this 9 purpose as its sensitiveness is affected by alc.; for strong alc. solns. it indicates too high an alky. A. P.-C.

Germination of malt in presence of potassium permanganate. I. Filatov. *Spirto-Vodochnaya Prom.* **15**, No. 12, 24–5(1938); *Chimie & industrie* **42**, 554.—By adding 0.01 g. $KMnO_4$ per l. of soaking water the time of germination is shortened by as much as 2 days, the starch

loss is reduced and germination yield is increased by more than 10%. A. Papineau-Couture

Report on malt analyses for the months of November and December, 1938. F. Ancker. *Wochschr. Brau.* **56**, 22(1939); cf. *C. A.* **33**, 8909[8].—Summary and discussion of 375 barley malt and 8 wheat malt samples. S. J.

Report on malt analyses for January and February, 1939. F. Ancker. *Wochschr. Brau.* **56**, 86–7(1939); cf. preceding abstr.—Summary and discussion of results on 346 barley malt and 7 wheat malt samples. S. Jozsa

Determination of malting losses. R. Kutscha. *Wochschr. Brau.* **56**, 98–101(1939).—The following losses are considered: (1) difference between moisture content of barley and malt, (2) losses due to handling, (3) steeping losses, (4) loss on sprouts and (5) respiration losses. The following figures for pale and dark malt are given (3) 1.0 and 1.0, (4) 3.7 and 4.5, (5) 5.8–7.5 and 10.5 and 13.5% for total losses. It is more convenient to det. the total loss than to calc. it from the sum of individual losses. The total loss might be detd. by weighing the barley steeped and the malt obtained or by detg. the 1000 kernel wt. of barley and malt. In order to det. the yield on dry basis the moisture content of barley and malt must be taken into consideration. Figures of earlier investigators suggest that 1% subtracted from the 1000 kernel wt. value gives a figure in close agreement with weighing. An increased loss must be taken into consideration with barley of high protein content. Protein contents ranging from 8.88 to 11.44% were found to correspond to dry basis losses of 9.78 to 12.49% for undried barley and 9.47 to 10.85% for dried barley. In case the 1000 kernel wt. is used two batches of 4000 kernels each should be tested. The error is still 0.5–1.0%. S. Jozsa

Estimation of lactates in soured mashes. F. Monroe Powers. *Chemist-Analyst* **29**, 4(1940).—Take sample to correspond to about 0.5 g. lactic acid. Add 5 drops H_2SO_4 and 50 ml. of ether. Stir, add 12 g. of Na_2SO_4 and allow to stand at least an hr. with occasional breaking up of the solid layer. Filter and wash the residue with Et_2O. Evap. to 5 ml., take up in 50 ml. of water, boil with 2 g. $BaCO_3$ and filter off $BaSO_4$ and excess $BaCO_3$ after 15 min. Wash with water, bring to a boil and titrate with 0.1 *N* H_2SO_4 to a methyl red indicator. Or, add to the filtrate from the $BaSO_4$ ppt., 5 drops of HCl and 5 drops H_2SO_4 while stirring, filter through a Gooch crucible and weigh the $BaSO_4$ which is equiv. to the lactic acid present. W. T. H.

Degradation of starch in cooked (heated) mashes. P. Kolbach and G. W. Haase. *Wochschr. Brau.* **56**, 105–9, 113–18, 124–8, 134–6, 140–3(1939).—Windisch, Kolbach and Schild investigated the starch degradation in mashes in regard to time, temp., pH and concn. (cf. *C. A.* **26**, 1382). The present investigation is concerned with the inhibition of amylase and proteinase at higher temps. (70–100°). The "cooked mash" was prepd. by using 50 g. malt flour and 200 ml. water at 35° and rapidly heating the infusion on a water bath to approx. 100° in order to eliminate enzyme action as well as possible. A practically complete inhibition was attained when the "cooked mash" was prepd. at pH 7.6. The starch degradation was studied on these mashes by addns. of a malt infusion. The effects of various quantities of enzyme, temp., time of mashing and pH were followed up in regard to starch liquefaction and maltose formation. The increase in total ext. was a measure for the liquefaction and an increase in fermentable ext. was the indication for maltose produced. The effect of various quantities of enzyme on maltose formation showed that amts. of enzyme ext. exceeding 2.5 ml. (of an original cold infusion of 100 g. malt in 400 ml. water) did not materially increase the maltose content. Up to a cleavage limit of 33% the law of proportion is valid. The temp. optimum for liquefaction depends on the pH. For a one-hour mashing period with 5 ml. malt infusion the pH values and temp. optimums, resp., were: 6.6, 55–60°; 6.0, 60–65°; 5.1, 55–60°; 4.5, 50–55°; 4.2, 45–50°. The temp. optimum for maltose formation at normal pH values barely depends on the time of mashing and is within 55–60°. The highest temp. is particularly favorable, but at lower temps. only a small decrease in maltose formation was found. The pH values and optimum temps. for one hr. with 5 ml. malt infusion follow: 6.6, 55–60°; 6.0, 55–60°; 5.1, 50–55°; 4.5, 45–50°; 4.2, 35–40°. The pH optimum for liquefaction depends on the temp.; however, the optimal zones are rather broad and not well defined. Values for temps. and pH optimums for one hour mashing with 5 ml. infusion are: 20–40°, 4.0–4.5; 50°, 4.9–5.3; 60°, 5.1–5.5; 65°, 5.5–5.9. It was difficult to det. correctly the pH optimum for maltose formation. The regions investigated represent a broad optimal zone with a sharp break toward the acid side. The following figures for temps. and pH optimums were obtained under the same technique as used for liquefaction: 20–40°, 4.0–4.5; 50°, 4.4–5.0; 60–70°, 5.7–6.2. A decided inhibition in maltose formation took place at a max. cleavage of 60%. The study of a max. of fermentable ext. in a "cooked mash" was made in line with Lüers' and Weininger's method used on barley starch (cf. *Z. ges. Brauw.* **1925**, 35). The addn. of yeast complement did not increase the amt. of maltose. At 40° and 48 hrs. 50 ml. malt infusion at pH 5.0 produced the max. fermentable ext. The difference between a regular and a "cooked mash" is readily shown by the velocity with which fermentable ext. is formed. An addn. of malt infusion to a "cooked mash" causes but slight protein cleavage. S. Jozsa

Acidification of brewers' spent grain. II. R. Koch and R. Weissmann. *Wochschr. Brau.* **56**, 81–5, 101–3, 109–11(1939); cf. *C. A.* **33**, 3899[2], 7039[4].—Silage of grain was studied under the following conditions: (1) with lactic acid organism and ½% of sugar as nutrient; (2) like (1) but 1% sugar; (3) with 1.46 l. of concd. HCl per 1000 kg. of grain and 1% sugar; (4) like (3) but including lactic organisms; and (5) without any addn. Little change was noticed on (1) and (2); they remained practically solid masses. A considerable gas formation took place in (3) and (4) and decompn. took place on (5). The pH was found to be 3.9, 3.7, 4.2, 3.9 and 4.5, resp. In testing the finished grain for sugar all gave neg. reaction except (5) which was faintly pos. The indole test was neg. on all samples showing the absence of *B. coli*. Total and free lactic, butyric and acetic acids were studied. A quant. and qual. study of the microörganisms present follows. The final conclusions are in line with the chem. examn. A spontaneous fermentation will produce an objectionable fodder. Acidification with HCl is unnecessary and it has a disadvantage in suppressing the lactic organisms. S. Jozsa

Oxidation in beers. III. Oxidation in the brewing process. Philip P. Gray, Irwin Stone and Harold Rothchild. *Wallerstein Labs. Commun. Sci. Practice Brewing* No. **7**, 49–60(1939); cf. *C. A.* **33**, 9537[6].—The origin of reducing substances of beer has been studied. They are present largely in a sol. condition in malt, but the amts. present are increased by extractives from the hops and as a result of reactions taking place during wort boiling. Contrary to the findings of previous investigators, significant development of reducing power for the beer itself during fermentation does not take place. The beer itself is continuously subjected to oxidation factors from the mashing stage to the end of the brewing process, including fermentation. Various factors involved at each stage of the brewing process are noted, and the role of oxidation in practical brewery work is discussed. G. W. Kirby

Neutralization and purification of the hydrolyzate of straw for use as a medium for growth of forage yeast. S. G. Mashevitskaya. *J. Applied Chem.* (U. S. S. R.) **12**, 1034–8(in French, 1038)(1939).—The hydrolyzate was passed through a layer of powd. phosphorite and the pH adjusted by means of NH_4OH. The product contained amts. of phosphate and N necessary for the growth of yeast. The pH of hydrolyzate during the fermentation stayed within 5.4–5.6 and a white yeast of normal consistency was obtained. A. A. Podgorny

Preparation of autolyzates from spent yeast. S. Konovalov. *Spirto-Vodochnaya Prom.* **15**, No. 9, 22–4(1938); *Chimie & industrie* **42**, 553.—The autolysis medium must

have the optimum pH of 6.5. If dried unwashed yeast (contg. acid wort residues) is used, it is necessary to add a certain amt. of alkali (about 0.12 g. per 100 cc.). Optimum autolysis temp. is 48–9°; the water should be heated before adding to the yeast. After autolysis the soln. is sepd. from the yeast and heated at 100° for 10–20 min. to sterilize the autolyzate. A. Papineau-Couture 1

New yeast types produced by hybridization. O. Winge and O. Laustsen. *Compt. rend. trav. lab. Carlsberg, Sér. physiol.* 22, 337–55(1939).—Fourteen hybrids have been produced as a result of micromanipulation of the spores of selected parents, giant colony appearances of parents and hybrids being shown and other characters described. Production of sp. enzymes (invertase, raffinase, or melibiase) is a dominant character. Consideration of percentage of spore germination allows decision as to whether the parents are of the same species. Biochem. differences run parallel with differences of species. Spores of top yeast may segregate bottom yeast types. Use of raffinose-fermenting power as a distinction between bottom and top yeasts is unjustified. Appearance of spores does not distinguish wild and culture yeasts. One of the new hybirds has found satisfactory tech. application. B. C. P. A. 2

Chem. and technological examn. of Lybian barley (Copertini) 12. Corrosion resistance of monel to beer (Siegfried) 9. Investigations on fermentations appearing in diffusers with reuse of waste water, and their control (Reindel, *et al.*) 28. Vitamin B and C concentrate from yeast (U. S. pat. 2,184,748) 17.

17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W. O. EMERY

Unit operations in drug manufacture. G. W. Bengert. *Ind. Eng. Chem.* 32, 461–4(1940).—In drug manuf., where numerous products are made, the use of equipment for multiple processing operations becomes an economic necessity. Because of the fact that most pharmaceutical manufg. operations are of the batch type, the nature of these operating problems demands small versatile operating units, easy to handle and to clean. Only certain processes, such as the prepn. of milk of magnesia, can be continuous and they can take advantage of the economy to be derived from a planned unit, designed for one purpose and for a max. efficiency. B. describes how one company has adapted unit equipment to numerous processing requirements in its drug extn., liquid prepn. and ointment product departments. The production of milk of magnesia by countercurrent decantation methods is also described. Edward A. Ackermann 5

Distribution of doses in assay of estrone. W. Heubner and J. Brockmeier. *Arch. exptl. Path. Pharmakol.* 191, 355–7(1939).—Estrone in oily soln. was injected into rats. There was no difference in effect whether the total amt. was given in the course of 2 or 3 days. B. C. P. A. 6

The vitamin B_1 potency of tiki-tiki extract, CPUP brand. Segundino G. Jao. *Acta Med. Philippina* 1, 153–69(1939).—The prepn. of tiki-tiki ext., CPUP brand (made by the College of Pharmacy, Univ. of the Philippines), as described by Santos in 1936, is given in detail. One cc. of the ext. contained 12.5 I.U. vitamin B_1 or approx. 50 Sherman units, when assayed by the rat growth method recommended by the U. S. P. XI Vitamin Committee. Ruth Berggren 7

The essence of Cymbopogon nardus of Sicily. F. Sorges. *Chim. ind. agr. biol.* 16, 21–3(1940).—The *C. nardus* Rendle (Java or Ceylon citronella) was imported into Italy from Java in 1928, and cultivated in Sicily. The essences obtained in summer, autumn and winter had, resp., d_{15} 0.889, 0.875, 0.890; n_D^{15} 1.470, 1.469, 1.471; α_D +1, +1, +1.6; soly. in 80% alc. 1:1.3, 1:1, 1:1.5; total geraniol 84.67, 70.36, 71.18%; free geraniol 30.62, 21.94, 5.80; citronellol 22.30, 20.03, 19.40; citronellal 21.60, 27.54, 52.18; citral 13.10, 24.25, 20.82; methylheptenone 0.8, 0.94, 1.20; alcs. other than those above 1.15, 0.85, 0.60; terpenes 2.25, 4.45, 6.20%. G. A. B. 8

Alkalimetry of "llipta" and its influence in the native cocaine mania. José Miguel Vallenas. *Bol. soc. quim. Peru* 5, 178–84(1939).—The llipta of Cuzco is prepd. from the dried stems of the goosefoot plant, and that of Puno is made from a similar plant, native to the Titicaca plateau, which the natives call Cañihua. The sun-dried stems of the plant without the fruit are collected in sheds and burned with free access of air. The stems are then kneaded with water and a little wine into small loaves, in accord with ancient custom, and dried. Llipta is a hard dense material powdered with gray powder which appears to be the ashes of the plant. It is easily ground in a mortar to give a black powder with a caustic astringent earthy taste, insol. in org. solvents and sol. in acids. The aq. soln. is strongly alk. Samples from Cuzco and Puno contain, resp., 38.0, 45.0% sol. in cold H_2O; 47.2, 52% sol. in hot H_2O; 89.0, 88.4% sol. in 20% HCl; 87.0, 88.7% sol. in 20% HNO_3; 44.0, 77.8% sol. in 20% H_2SO_4; 89.0, 84.6% sol. in aqua regia. Qual. analysis of the Cuzco product showed carbonate, chloride, sulfate and phosphate, Cd, Mn, Fe, Ca, Na and K. Quant. analysis showed the following percentages of the anions for the Cuzco and Puno products, resp.: 20.000, 23.000; 2.9275, 4.225; 4.4106, 3.1524; 16.608, 13.920. Further analysis showed 1.327, 0.646% NH_3; 6.259, 1.302% K; 3.881, 9.976% Na; 11.2956, 6.4605% Ca; 0.000, 10.886% Al; 0.5908, 3.886% Fe; 11.240, 15.800% H_2O; 11.000, 11.300% insol. in acid. Titration with *N* acid and phenolphthalein showed the equiv. of NaOH as follows: cold-extd. Cuzco 5.52, 12.72%; Puno 10.00, 21.20%; hot-extd. 6.4, 13.04%; 7.40, 19.80%, resp. By Winkler's method, detn. of Na_2CO_3 showed 19.875, 23.585% and 25.44, 27.95%, resp. An attempt to det. hydroxides in the presence of carbonates by the method of R. B. Warder gave neg. results. Detn. of alk. bicarbonate gave values from 13.8631–36.5435%, and of carbonate from 0.265 to 14.84%, in addn. to 25–35% $CaCO_3$. Colorimetric detn. of pH of 5% solns. of llipta from Cuzco and Puno gave 9.6 and 9.8, resp. The Indians chew 30–50 g. of coca leaves per day and add 5% of llipta, which liberates the alkaloid. Treatment of 30 g. of coca leaves with 5% llipta and extn. of the alkaloid showed isolation of 0.701% (Cuzco) and 0.827% (Puno), corresponding to 0.2103–0.2408 g., of cocaine. W. F. Bruce 9

The activity of chlorine-containing disinfectants in different nitrogenous substrates with special reference to azochloramide. R. W. Vierthaler and H. Gebauer. *Z. Hyg. Infektionskrankh.* 122, 281–9(1939).—Azochloramide retains marked oxidizing properties even after 24 hrs. of contact with large amts. of nitrogenous material. It is recommended as a good wound disinfectant. Rachel Brown

Anesthesia. The conquest of pain. Edward Podolsky. *Am. Professional Pharmacist* 6, 30–2, 98–9(1940); cf. *C. A.* 34, 1074⁸.—Spinal, basal and local anesthesia and anesthetics are discussed. H. M. Burlage

Assay of ointment of mercurous chloride. *Rept. Am. Pharm. Assoc. Lab. Bull. Natl. Formulary Comm.* 8,

157–60(1940).—The following volumetric method which is applicable for the detn. of the Hg ion only and not for the Cl ion is found to be a suitable substitute for the gravimetric method: Weigh 10 g. of the ointment into a 250-cc. wide-mouth Erlenmeyer flask, add 15 cc. of HCl and 25 cc. of Br-H_2O, heat on a steam bath for 15 min. with occasional vigorous shaking. After the aq. layer has completely sepd. from the base, chill in cold H_2O and when the base has solidified at the surface, puncture it with a stirring rod and transfer the aq. layer to a 250-cc. volumetric flask, filtering through cotton. Digest the base again with 10 cc. HCl, 10 cc. H_2O and 5 cc. Br-H_2O, cooling and sepg. as before; repeat this procedure twice more, filtering the aq. acid exts. into the 250-cc. volumetric flask. Dil. to vol. and mix thoroughly. Transfer a 50-cc. aliquot of this soln. to the 250-cc. glass-stoppered Erlenmeyer flask and boil gently to remove the Br_2. Cool, dil. to about 50 cc. and make alk. with 10% NaOH, adding 15 cc. in excess. Add 2 cc. of 40% HCHO and let stand for 30 mins. with occasional agitation. Make acid with AcOH, adding 2–3 cc. in excess, and add 40 cc. of 0.1 *N* I_2, shake vigorously to dissolve the Hg. Titrate the excess I_2 with 0.1 *N* $Na_2S_2O_3$ using starch paste as indicator. 1 cc. 0.1 *N* I_2 = 0.0118 g. HgCl. H. M. Burlage

Assay of ephedrine spray and compound ephedrine spray. Charles O. Wilson. *Bull. Natl. Formulary Comm.* 8, 166–7(1940).—Weigh accurately into a small tared beaker 5–10 g. of the sample; transfer to a small separator, rinsing the beaker several times with 5-cc. portions of Et_2O until the inhalant is completely transferred. Add 10 cc. aq. soln. of H_2SO_4 (1–50) and shake gently. Transfer the acid layer to a 2nd separator, shake the oily residue with four 10-cc. portions of the acid. Test for complete removal of the alkaloid. Neutralize the combined acid solns. with dil. NH_4OH and add 5 cc. in excess. Ext. the alk. soln. with 30 cc. of washed ether. Wash the ether ext. with 1 cc. H_2O, adding the washing to the main aq. soln. Filter the ether ext. into a 250-cc. Erlenmeyer flask through a pledget of cotton wet with ether. Test for complete removal of the alkaloid. Wash each of the ether exts. with 1 cc. H_2O. Evap. the ether to about 5 cc. on a H_2O bath so adjusted that the temp. of the ether will not rise above 30°. Remove from the bath, add 50 cc. 0.02 *N* H_2SO_4 and heat further on the bath to completely dissolve the alkaloid and evap. the remainder of the ether. Titrate the excess acid with 0.02 *N* NaOH with bromothymol blue as indicator. Each cc. 0.02 *N* H_2SO_4 = 0.0033 g. ephedrine. H. M. Burlage

Antiseptic tests. Esther Meyer and E. N. Gathercoal. *Bull. Natl. Formulary Comm.* 8, 171–80(1940).—A report dealing with exptl. work carried out in order to perfect testing methods for colloidal HgCl ointment and compd. powder of $ZnSO_4$. The tests and materials recommended are described in detail. H. M. Burlage

The assay of ichthamol. Rept. Am. Pharm. Assoc. Lab. *Bull. Natl. Formulary Comm.* 8, 193(1940).—The following method was used: Transfer 0.7–1.0 g. of the sample, accurately weighed, into a Kjehdahl flask with the aid of 30 cc. H_2O. Add 5 g. $KClO_3$, then add slowly 30 cc. of HNO_3 and evap. the mixt. to about 5 cc. Transfer the residue into a 300-cc. beaker with the aid of about 25 cc. HCl and again evap. to about 5 cc. Add 100 cc. H_2O, heat to boiling, filter and wash. If no insol. residue remains, ppt. the hot soln. with $BaCl_2$, filter, wash, ignite the resulting $BaSO_4$ and weigh. H. M. B.

The synthesis of pentadecanoic acid. Charles F. Krewson. *Pharm. Arch.* 11, 12–6(1940); cf. *C. A.* **34**, 1614⁴.—Procedures are outlined with tetradecyl bromide and tetradecyl iodide as intermediaries. The results indicate that the iodide procedure is far less time consuming and gives substantially better yields. The prepn. of tripentadecanoin is described. H. M. Burlage

The vitamin A and vitamin D contents of some Australian fish liver oils. M. M. Cunningham and E. C. Slater. *Australian J. Exptl. Biol. Med. Sci.* 17, 457–64(1939).—The vitamin A content of snapper shark (*Galeorhinus australis*) liver oil is highest in the winter, corresponding to a min. oil content of the liver. The livers of 4 species of the tuna and the skate had lower vitamin A contents than did snapper shark liver. Gummy shark (*Mustelus antarcticus*) and snapper shark liver oils gave the very low results of 1 and 2 international units per g., resp. Edward Eagle

Application of inert gases in medicine. Gerhard Siewert. *Deut. Apoth.-Ztg.* 54, 1200–1(1939).—The application of helium, neon, argon, krypton, xenon and emanation to certain phases of medical practice is described. Ten references. W. O. E.

Estimation of alkaloids in cinchona. Hans Wojahn. *Deut. Apoth.-Ztg.* 54, 1224–6(1939); cf. *C. A.* 33, 3968⁶, 8355⁴.—It is shown that in estg. alkaloids in cinchona (Swiss Pharm. V), the prescribed HCl for liberation of the alkaloids is omitted and the drug heated only with H_2O, so that a bark of 5–6 sieve fineness yields scarcely differing alkaloid values. If HCO_2H is used, however, the alkaloid content is greater. In drugs of 4 sieve fineness the alkaloid content becomes greater with HCl than if heated only with H_2O. The highest values are obtained with HCO_2H. If cinchona is heated only with H_2O, about 50% of the available alkaloids goes into soln. Even by use of HCl and HCO_2H only incomplete resolution of alkaloid-tannin compds. is possible. In estg. alkaloids in cinchona, a certain portion is liberated only by an excess of alkali. W. O. E.

Yarrow oil. W. Peyer. *Deut. Apoth.-Ztg.* 55, 1–2 (1940).—Yarrow blossoms yield a blue oil in amts. of about 0.5%. The plant itself (stem and leaves) also yields the blue oil. The color is darker than that of camomile but the oil is not preformed in the plant. Steam is required for its formation, or rather for the formation of the azulene portion. For the complete exhaustion of the drug, a distillate of at least 1200 cc. is necessary. W. O. E.

Coffee char and its possibilities. W. Peyer. *Pharm. Zentralhalle* 81, 1–5(1940).—Coffee char is efficacious on various surface wounds, notably supperative and foul-smelling wounds. Five com. coffee chars were examd. with respect to mineral content, hot-H_2O ext., alky. of ash, adsorptivity for methylene blue and acid-fixation capacity (due to adsorption and in part also neutralization). The presence of essential oils could not be verified. The mineral content of coffee char is, as expected, higher than that of the ordinarily roasted bean. Only in the case of 2 coffee chars could the odor of roasted coffee be detected. 14 references. W. O. E.

Pharmaceutical iron preparations and their estimation. G. Dultz. *Pharm. Zentralhalle* 81, 37–43, 49–54(1940). W. O. E.

Behavior of Belgian frogs in relation to Trevan's dose-mortality curve in the assay of digitalis. P. Deltour *Quart. J. Pharm. Pharmacol.* 12, 677–9(1939).—The dose-mortality curve obtained by the injection of digitalis into Belgian frogs shows complete accordance with Trevan's curve. Two references. W. O. E.

Suppository bases for use in tropical countries. A. F. Caldwell. *Quart. J. Pharm. Pharmacol.* 12, 680–8 (1939).—The addn. to cacao butter of substances sol. in fats rapidly lowers the m. p. and also lowers the transition temp. The use of hardening agents such as beeswax is not recommended, as the transition temp. is too close to the temp. at which the mixt. softens sufficiently to mold suppositories. In temperate climates hardening agents may be satisfactory, but for the extemporaneous dispensing of suppositories in the tropics they are useless. With proper manipulation and correct control of temp., with a thermometer, suppositories can be made in tropical countries with cacao butter provided they do not contain medicaments that lower the m. p. to such an extent that they remain soft at room temp. It is recommended that the monographs of the Brit. Pharmacopeia and Brit. Pharmaceutical Codex be modified, as they are of no assistance in the present form to dispensers in the warmer parts of the Brit. Empire. The statement that the base should melt at 37° means very little unless the method of taking the m. p. is given. It is recommended that a base should be just pourable at temps. not above 40°. Hydrogenated palm kernel oil having the phys. and chem.

characters shown in the previous report is suitable for use as a suppository base in warm climates. In cases where the base is too soft owing to a high temp. or where the m. p. is lowered by sol. medicaments it may be hardened by the addn. of hydrogenated soybean oil, m. 56°, or beeswax. For general use in Malaya in suppositories contg. no sol. medicament the addn. of 5% of hardened soybean oil is satisfactory, but if fat-sol. substances are present the amt. of hardening agent must be increased. There is little change in a metastable state when the palm kernel oil is heated to temps. well above the softening point and the lowering of the m. p. due to this change is too small to be of any practical significance. The cost of hardened palm kernel oil compares favorably with that of cacao butter. W. O. E.

Hydrogenated fats in the preparation of ointment bases for tropical countries. A. F. Caldwell. *Quart. J. Pharm. Pharmacol.* **12**, 689–98(1939).—Hydrogenated palm-kernel oil, m. 40–2°, is a suitable fat to replace lard and suet in ointments in tropical countries. By varying the degree of hydrogenation the m. p. of the hydrogenated fat can be altered. It shows little tendency to become rancid. A mixt. of hydrogenated palm-kernel oil with 12.5% of soft paraffin forms a suitable ointment base for use in Malaya, where absorption or penetration of the ointment is required. Six references. W. O. E.

Stability of staphylococcus α-antitoxin at different temperatures. M. Llewellyn Smith. *Quart. J. Pharm. Pharmacol.* **12**, 699–700(1939).—The loss of potency of staphylococcus α-antitoxin, when stored in sealed ampoules, is independent of the original potency of the antitoxin, of the protein content, of the processes involved during prepn. and of the presence of phenolic preservative. Stored at 35° the antitoxin loses potency at a rate of about 30% per annum during the 1st 18 months. Stored at room temps. not exceeding 20°, the rate of loss of potency is not greater than 10% per annum, while at 4° the antitoxin is very stable, since after storage at this temp. for 3.5 yrs., the loss of potency was only 5%. W. O. E.

Stability of solutions of standard diphtheria antitoxin at different temperatures. M. Llewellyn Smith. *Quart. J. Pharm. Pharmacol.* **12**, 707–12(1939).—Solns. of standard diphtheria antitoxin in 66% glycerol-saline were found to lose less than 10% of their potency during storage at −4° for 6 yrs.; at room temp. a loss of about 23% occurred after storage for 4 yrs.; and at 35° the potency declined to ½ after storage for 9 months. W. O. E.

Dosage-response relation in the cross-over rabbit test for insulin. II. E. C. Fieller, J. O. Irwin, H. P. Marks and E. A. G. Shrimpton. *Quart. J. Pharm. Pharmacol.* **12**, 724–42(1939); cf. *C. A.* **33**, 8357⁷.—In a previous paper the cross-over rabbit tests for insulin were discussed when conducted over a period of 10 yrs. The present paper deals with similar tests, the object being to investigate the behavior of the log (dose)-response relation underlying the cross-over test, and hence the degree of accuracy of the test, when the criterion used for interpreting the test is taken as (1) the difference between the av. percentage reductions in blood sugar on test and on standard (standard test); (2) the ratio of these av. reductions (test/standard). On part of the data the effect has been studied of taking as the criterion the difference between av. reductions (standard-test) corrected for the difference between av. initial blood-sugar levels. Seven references. W. O. E.

Cough remedies familiar to the ancients. H. Schwab. *Süddeut. Apoth.-Ztg.* **79**, 237–8(1939). W. O. E.

Plant narcotics and intoxicants. R. Lillig. *Süddeut. Apoth.-Ztg.* **79**, 875–6, 883–4, 891–2(1939). W. O. E.

More recent works on domestic drug plants. Heinz Harms. *Süddeut. Apoth. Ztg.* **80**, 2–6, 9–10(1940); cf. *C. A.* **34**, 1441⁹.—An address. 43 references. W. O. E.

Vitamin A contents of liver oils of Brazilian desmobranchs (sharks and rays). Genneville Hermsdorff and Oswaldo de Lazzarini Peckolt. *Bol. ministério agr. (Brazil)* **28**, No. 7–9, 83–104(1939).—Vitamin A was detd. in the oils by the $SbCl_3$ method. Liver oil of *Sphyrna zygaena* (hammerhead shark) contained 36–40, that of *Carcharias limbatus* 10–25, that of *Carcharias lamia* 10, that of *Odontaspis americanus* 2–10 and that of *Isurus oxyrhynchus* about 5 times as much vitamin A as standard cod-liver oil. Liver oils of *Rhinoptera jussieui* and *Manta ehrenbergii* contained about the same amt. as cod-liver oil and that of *Galeocerdo maculatus* contained less. L. E. Gilson

Passage of procaine salts through a cellophane membrane. Influence of addition of sodium chloride, variations in pH and temperature and thickness of the membrane on the passage of procaine hydrochloride. Jean Régnier, André Quevauviller and André Fieyre. *Compt. rend. soc. biol.* **132**, 399–402(1939); cf. *C. A.* **34**, 1442⁷.—Rate of diffusion through the membrane was decreased by addn. of NaCl, increased by increase in temp., little affected by change in pH, and it varied inversely with the thickness of the membrane. **Influence of the acid combined with the procaine base.** *Ibid.* 402–4.—The rate of diffusion of procaine salts through a cellophane membrane decreased in the order, hydrochloride, salicylate, phenylpropionate, phenylacetate, isobutyrate, benzoate, tartrate, glyconate and citrate. **Passage of hydrochlorides of various local anesthetic bases through an inert cellophane membrane.** *Ibid.* 457–9.—The HCl salts diffused through the membrane in the following decreasing order, percaine, cocaine, stovaine and procaine. L. E. G.

Bark and leaves of Cecropia adenopus Mart. (family Moraceae). Luis Floriani. *Rev. centro estud. farm. bioquím.* **29**, 132–6(1939).—The fresh bark of this South American tree yields about 0.015% of the alkaloid cecropine. The leaves contain a heteroside, hambain, which yields glucose and (h)ambaic acid upon hydrolysis. The leaves also contain hambainine (or ambainine), $C_{12}H_{16}N_2O$, which is neither a heteroside nor an alkaloid, though basic, and which has no hemolytic action. The roots contain the alkaloids cecropine and cecropidine. An infusion of the leaves is used as an expectorant, antiasthmatic and cardiotonic. It reinforces the action of digitalis. L. E. G.

Bleach ointments. D. D. Moir. *Analyst* **65**, 154–8(1940).—Bleach ointment is a mixt. of equal parts bleaching powder and white petroleum jelly. It is used for first-aid treatment of mustard gas casualties. The available Cl of the powder used should not be less than 30%. *To det. available Cl*, take 1 g. of ointment in a glass-stoppered flask of about 200 ml. capacity. Add 20 ml. of CCl_4, rotate gently and heat if necessary to dissolve all the jelly. Add 100 ml. of water and shake. Now add 2 g. KI and 5 ml. of 33% AcOH by vol. Shake and titrate the liberated I_2 with 0.1 *N* $Na_2S_2O_3$. The analytical results obtained in examg. some 40 com. samples are tabulated. Of these 21 were passed as satisfactory and the av. available Cl was 14.8%. After about 3 months the av. was reduced to 13.3%. Some of the poorer samples contained only about 2% available Cl. It is felt that the purchaser of ointment should get about 14% available Cl. W. T. H.

Simple and rapid procedure for the analyses of essences, concrete and absolute, by codistillation with ethylene glycol in a partial vacuum. Sébastien Sabetay. *Ann. chim. anal. chim. appl.* **21**, 173–6(1939).—When an ethereal soln. of a perfume is distd. under reduced pressure, the residue contg. the essential oil and some of the plant waxes is called a *concrete*. If this is dissolved in alc. and the plant waxes are removed, the residue after evapn. of the alc. is called an *absolute*. Thus, one can purchase on the market both concrete flower oils and absolute flower oils, the latter being more expensive. These are usually evaluated by detg. various consts. of the oil. If a mixt. of concrete or absolute essence is mixed with glycol and distd. under 8–15 mm. pressure at 95–100°, all of the essential oil can be driven over, sepd. and measured. Take 1–10 g. of the perfume and 20 ml. of glycol and distil at 90–100°. As a rule, the residue in the flask will have little odor, but, if necessary, 20 ml. more of glycol can be added and the distn. repeated a second and possibly a third time. To the first distillate add 100 ml. of water and to the second 50 ml. of water. Sat. each with about 30 g. of salt and shake 3

times with 20-ml. portions of a mixt. of equal parts pentane and ether. Sat. with anhyd. Na_2SO_4, filter and wash with the ether+pentane. Filter and distil off the solvent under 15–20 mm. pressure, weigh and det. the physicochem. consts. of the residue. The results obtained in the study of some 14 perfumes are tabulated. W. T. H.

Detection of streptocide. S. E. Burkat. *Farm. Zhur.* 1938, No. 3, 26–9; *Khim. Referat. Zhur.* 2, No. 5, 105 (1939).—Streptocide is *p*-(2,4-diaminophenyl)azobenzenesulfonamide hydrochloride. Its most characteristic reactions are: (1) An examn. of the streptocide sublimate under a microscope shows fern-like aggregates, which sometimes have a shape of jagged crosses. With a drop of a 36% HCl soln. they form colorless rectangular crystals. (2) One cc. of the aq. soln. of streptocide is decolored by heating it with Zn dust and 1–2 cc. of 2 *N* H_2SO_4. The decolored soln. produces a red color when heated with 2–3 drops of a 3% H_2O_2 soln., a cherry-red color with 3–4 drops of $(NH_4)_2S_2O_3$ and a violet-red color with 2–3 drops of a Br soln. in KBr. (3) Aq. streptocide soln. produces characteristic needles (visible under the microscope) when heated for 1–2 min. with 4–5 drops of Ac_2O. The sensitivity is 15 γ. (4) After having boiled 0.01 g. of streptocide with 1 cc. of a 36% HCl soln. the examn. of a drop of the hot filtered soln. under a microscope shows orange prismatic crystals. W. R. Henn

The polarographic method in pharmaceutical chemistry. F. Reimers. *Dansk Tids. Farm.* 14, 1–27(1940).—A discussion of the application of the method of Heyrovsky (cf. *C. A.* 29, 4896[9]) and co-workers to biochem. solns. Otto Johnson

Sucrose solutions for injection. Knud K. Jesperson. *Dansk Tids. Farm.* 14, 27–32(1940)(English summary).—A 50% sucrose soln. was prepd. by substituting 100 ml. of McIlvaine's phosphate-citrate buffer of pH 7.8 for 100 ml. of water in each l. The resulting soln. had a pH of 7.4 and withstood hydrolysis on heating to 100° for 1 hr. and on storage for 2 to 3 months. Otto Johnson

The chemical assay of ergot. Svend Aage Schou and Mogens Tønnesen. *Dansk Tids. Farm.* 14, 33–44(1940)(English summary); cf. *C. A.* 33, 1444[2].—A report of a comparison between the methods of Hampshire and Page (cf. *C. A.* 30, 5364[8]) and Daglish and Wokes (cf. *C. A.* 34, 851[9]). Slightly higher results are reported for the second method. **The alkaloid content in fluidextract of ergot and in soft extract of ergot.** *Ibid.* 44–7(English summary).—Fluidextract prepd. according to Danish Pharm. 1907 contained 90% of the ergometrine of the original drug and 52% of the ergotoxine. The ext. prepd. according to Danish Pharm. 1933 contained 90% of the ergometrine and 85% of the ergotoxine. Otto Johnson

Method for determining the effect of chemical antiseptis on phagocytosis. Henry Welch and Albert C. Hunter. *Am. J. Pub. Health* 30, 129–37(1940).—The method is based on the complete inhibition by antiseptics of the phagocytes of artificially opsonized staphylococci. The toxicity and germicidal power of 10 germicides are reported. The "toxicity indices" agree closely with those computed by Salle, *et al.* (cf. *C. A.* 32, 6395[8]). Seven references. J. A. Kennedy

The latex of Ficus pumila L. I. History, proximate composition and anthelmintic properties. Conrado F. Asenjo. *Puerto Rico J. Pub. Health Trop. Med.* 15, 141–7 (1939).—The latex of *Ficus pumila* L. possesses proteolytic activity. The latex has been resolved into 6 proximate constituents besides water. Of these, there are 2 cryst. substances with sharp m. p. (184–185°; 68–69°, waxy). There are also a yellow-green dialyzable substance, a crude protein fraction, an inert powder, and a sticky transparent substance sol. in petr. ether and benzene. The proteolytic activity is present in the protein fraction and is totally destroyed at 85–90° for 5 min. The crude latex and also the protein fraction obtained from it digest certain species of parasites. The active principle of the protein fraction does not hemolyze rabbit blood. A review of all the pharmacol. and pharmacochem. literature on the latexes of *Ficus*. 50 references. J. A. Kennedy

Anomalous reaction of aristochin. M. Wagenaar. *Pharm. Weekblad* 76, 1544–5(1939).—When quinine salts are prepd. by dissolving the carbonate, aristochin, in dil. mineral acids, they exhibit anomalous behavior. Thus the bisulfate fluorescence is greenish blue instead of blue. Crystn. of the iodo-sulfate or -selenate of quinine from aristochin is more difficult than from the pure salts. It is facilitated by use of acetone. Since the resulting crystals are identical the impurity is probably a deriv. or conjugate substances. The speed of reaction and the yield are a function of the purity of the quinine salt, e. g., as obtained by repeated recrystn. from aristochin. The iodosulfate can be crystd. by slow heating of aristochin in dil. NaOH. The residue is dissolved in dil. H_2SO_4 and KI-I_2 soln. is added. The brown ppt. is dissolved and the crystals are obtained from acetone. The nature of the impurity was not detd. S. R. Korman

Nicotine content in commercial cigarets. Carlos A. Grau, D. M. G. de Máspero and B. M. Agüero de García. *Semana méd.* (Buenos Aires) 1940, I, 410–12.—The nicotine content varied between 0.31 and 1.82%. It bore no relation to price, color or "strength" of the tobacco. A. E. Meyer

Acetylcholine and nervous inhibition in the heart of Venus mercenaria. C. Ladd Prosser. *Biol. Bull.* 78, 92–102(1940).—The isolated heart of the clam *Venus mercenaria* can be used as test material for drug assay. By use of a perfusion chamber, and keeping the tension and rate of flow of the perfusion fluid (van't Hoff's soln.) const. and keeping the temp. at 15–20°, a prepn. is obtained which is stable for at least 24 hrs. The clam heart was found to be sensitive to acetylcholine in dilns. of 10^{-12} during spring and 10^{-9} during fall. This drug seems to leave the contracting mechanism intact and to act on the pacemaker and conducting mechanisms of the heart. Stimulation of the visceral ganglion causes inhibition in diastole resembling the effect of acetylcholine. Atropine is very toxic to the heart. In nontoxic concns. it antagonizes neither the effect of acetylcholine nor of nerve inhibition. Fluid from a heart inhibited by visceral ganglion stimulation often depresses the beat of an eserinized test heart. Eserine prolongs the inhibition due to acetylcholine and that due to nerve stimulation. It appears likely that acetylcholine is liberated as the normal cardiac inhibitory agent in *Venus*. Dorothy A. Meyer

The alkaloid content of ergot. I. Quantitative determination of ergot alkaloids in separate sclerotia. Miklos v. Békésy. *Biochem. Z.* 302, 187–97(1939).—Details are given of the procedure for the colorimetric detn. of the alkaloid content of single sclerotia. In numerous analyses it was found that many sclerotia were entirely devoid of alkaloid while others were very rich in alkaloid content, which in some instances exceeded 1%. S. Morgulis

Preparation of colloidal gold solution. Rosalind Klaas. *Am. J. Clin. Path., Tech. Suppl.* 4, 42–4(1940).—Make a preliminary titration as follows: To 50 cc. of water add 0.5 cc. of 1% Na oxalate and 0.5 cc. of 1% gold chloride. To each of 8 Pyrex tubes add 5 cc. of this. To the first tube add 0.05 cc. of 0.02 *N* NaOH, to the second 0.1 cc., to the third 0.15 cc., etc. Place the tubes in a beaker of water and bring to boiling in 2 min., then boil 1 min. Usually only 1 tube will show the characteristic orange-red color. To 500 cc. of water in a l. Erlenmeyer flask add 5.0 cc. of the oxalate soln. and 5.0 cc. of the gold sol. with shaking, then add the amt. of NaOH as detd. by the preliminary titration. Neutralize with HCl using alizarin as an indicator as detd. by titrating a 5.0-cc. portion. Test the sensitivity by placing 5-cc. portions of the Au sol in a series of 6 test tubes, and adding to tube 1 0.1 cc. of a 1:400 soln. of edestin in 10% NaCl, to the remaining tubes add, resp., 0.2, 0.3, 0.4, 0.5 and 0.6 cc. of edestin. The reading after 18 hrs. should be 0, 1–2, 3, 4–5, 5, 5. J. T. M.

A study of the antibacterial activity of some fluorinated aromatic mercurials. Melvin F. W. Dunker and Thomas C. Grubb. *J. Bact.* 39, 243–54(1940); cf. *C. A.* 34, 399[4].—The antibacterial activity of the following compds. was studied: 4-fluorophenylmercuric chloride (I), 3-fluorophenylmercuric chloride (II), 2-fluorophenylmer-

curic chloride (III), 4-fluoro-2-acetoxymercuriphenol (IV), and 4-fluoro-3-chloromercuribenzoic acid (V). Against *Staphylococcus aureus*, III was most effective in aq. soln. and II in serum dilns. Against *E. typhosa* I was most effective in aq. soln. and V in serum dilns. When all factors were considered V was the most active compd. of the group. In serum dilns., the presence of F in the ring gave definitely more antibacterial activity than Cl in a similar position. This was not true for tests in aq. solns. 20 references. John T. Myers

Determination of the ester value of pharmaceutical waxes. B. Bobranski and A. Kowalewska. *Acta Polon. Pharm.* 2, 279–82(1938); *Chimie & industrie* 42, 672.—Comparison of Koettstorfer's standard method for the sapon. of the esters of waxes was made with Berg's modified method, which gives higher results owing to more complete sapon. Berg's modifications consist in: (1) use of a more active solvent (mixt. of abs. alc. and xylene instead of 95% alc.) and (2) heating over a wire gauze instead of in a water bath. A. Papineau-Couture

Chemical study of the flowers of Verbascum thapsiforma. S. Biniecki. *Acta Polon. Pharm.* 2, 287–98 (1938); *Chimie & industrie* 42, 672.—Analysis of the flowers of *Verbascum thapsiforma:* H_2O 11.18, ash 4.35, reducing sugars (as glucose) before inversion 20.45 (after inversion 1.45), pentosans 10.54, pectic matter (as galacturonic acid) 12.38, crude fiber 15.94, lignin 8.75, dextrins 1.19, tannins 3.84, waxes and volatile oils 4.02, N (as albumin) 6.41%. The ash contained: P_2O_5 0.63, K_2O 1.68, CaO 0.37, MgO 0.24, Fe trace, Mn trace, SiO_2 0.68, SO_3 0.23, Cl 0.07%. A. Papineau-Couture

Observations relative to the formation of stains on cigarettes. K. Tomur. *Inhys. Tutün Inst. Rap.* 2, 59–63(1938); *Chimie & industrie* 42, 561.—The production of stains on cigarettes is due chiefly to the hygroscopic properties of the veins of tobacco leaves, as compared to the parenchyma. To this defect of the veins must be added the lignin content which affects the taste of the cigarette. Other stains (greasy) can be due to caterpillars which are crushed between the tobacco leaves; to avoid them, these parasites must be vigorously combatted in the warehouses where the tobacco is stored.
A. Papineau-Couture

Hashish. Remziye Hisar and Sazile Edesen. *Kimya Annali* 3, 167–83(in Turkish)(in French, 183–93)(1938); *Chimie & industrie* 42, 561.—A study of the adsorption of the resin of *Cannabis* (in petroleum ether soln.) by animal charcoal, as a function of resin concn., of amt. of charcoal and of time of contact. The quantity of resin adsorbed is proportional to the quantity of charcoal and to the time of contact, but inversely proportional to the concn. of the soln. The higher the dilu., the greater the adsorption; it is complete for 100 cc. of soln. contg. 0.5 g. of resin, left in contact with 1 g. of charcoal for 2 hrs. A. P.-C.

Effect of heating on the physicochemical properties of tobacco. K. P. Dobrokhov, N. N. Batenina, V. A. Kossiak and M. A. Petrova. *Tabak* 9, No. 13, 8–9(1939); *Chimie & industrie* 42, 897.—Heating does not affect the nicotine content of high-grade tobaccos; with low-grade tobaccos, the nicotine decreases with temps. of 75° or over. With temps. above 75° the quality of high-grade tobaccos is impaired and that of low-grade tobaccos is improved.
A. Papineau-Couture

Relations between chemical form and activity of vitamin A in concentrates from fish-liver oils. Assay of vitamin A preparations. W. Grab. *Arch. exptl. Path. Pharmakol.* 193, 170–210(1940).—The conversion factor 1600 for calcg. the International Units (I. U.)/g. of vitamin A on the basis of the extinction coeff. is considered inaccurate because the biol. activity of vitamin A prepns. does not always correspond with this result. The difference is attributed to the chem. form of the vitamin, i. e., ester (I) or unsapond. (native), and alc. (axerophthol, II) or sapond. form. The I form is more active than II and more stable in oil solns. Thus the spectrophotometrically detd. *E* value and the blue value of I change little, if at all, under the influence of atm. O and light, while those of II drop to 1/3 the original figures. The conversion factor of 3400 ≐ 600 instead of 1600 is recommended for the I form and 1800 ≐ 400 for the II form of vitamin *A*. Vogan, an example of I, shows 120,000 ≐ 20,000 I. U./g. 63 references. J. Pinchack

New conceptions of the pharmacology and therapeutic use of iron. Fr. Eichholtz. *Med. Klin.* 35, 1279–82 (1939).—E. classifies Fe salts into ferrous and ferric salts not on an ionic but on a pharmacol. basis. He groups under ferrous salts ferrum reductum DAB, ferrous bicarbonate, $FeSO_4$, $FeCl_2$, ferrous ammonium sulfate, ferrum carbonicum cum Saccharo DAB, ferrous salts stabilized by sugar (ferrostabil), ascorbic acid (ferro 66) or ascorbic acid + cysteine (ceferro), ferrum lacticum DAB, ferrum citricum oxydatum and Na ferrocitrate. Under ferric salts he lists liquor ferri sesquichlorati DAB, $FeCl_3$, ferrum lacticum oxydatum, Fe_2O_3, $Fe(OH)_3$, ferrum oxydatum saccharatum DAB, liquor ferri albuminati DAB and Baudisch's active Fe_2O_3. Complex Fe compds. include hemoglobin, prepns. contg. hemoglobin or hemin, and compds. without Fe action (K ferro- and ferricyanide, dipyridyl Fe). J. Pinchack

New digitalis glucosides [review with bibliography]. A. H. Hrenoff. *Med. Record* 151, 175–5(1940).
J. Pinchack

Scientific advances in 1939 in disinfectants and antiseptics. Emil Klarmann. *Soap* (*Sanit. Products Sect.*) 16, No. 3, 109, 111, 113, 115, 117, 119, 121(1940); cf. *C. A.* 33, 4378⁴.—A review discussing methods, phenolic disinfectants, quaternary NH_4 compds., org. Hg compds., halogens, alcs., dyes, org. acids, arylsulfonamides, and radiation. Eighty references. Henry H. Richardson

The alkaloids of papaveraceous plants. XXIII. Glaucium flavum Crantz. Richard H. F. Manske. *Can. J. Research* 17, B, 399–403(1939).—Only two alkaloids have been found in *Gl. flavum* (cf. Fischer, *Arch. Pharm.*, 239, 427–37(1901); Gadamer, *C. A.* 6, 2140).—It therefore appeared to be of interest to search diligently for other alkaloids, since if only 2 alkaloids are elaborated by *Gl. flavum* it might be that several other species of *Glaucium* would elaborate only the same 2, and an attempt to elucidate, by means of the chem. constituents present, moot points in botanical classification of some of the poorly defined species would fail. Actually, in addn. to the 2 known ones, 4 other alkaloids were found in the mixt. of alkaloids obtained from 28.8 kg. material comprising young and mature plants and roots. The HCl salts of the alkaloids extd. from aq. soln. with $CHCl_3$ contained the nonphenolic bases glaucine (I) (0.67%), luteanine (0.018%), m. 183°, $[\alpha]_D^{25}$ 205° (*c* 0.4, MeOH) and alkaloid F 47 (less than 4 p. p. m.), m. 280°, an apparently *new* alkaloid that dissolved in H_2SO_4 to yield a yellow soln. that darkened on heating and then turned purple. Isocorydine (about 4 p. p. m.), m. 184°, was isolated from the phenolic base fraction, extd. as HCl salt from aq. soln. by $CHCl_3$, but no corydine could be found. In the fraction not extd. as HCl salts from aq. soln. by $CHCl_3$, protopine (II) (0.046%), m. 210°, was the only nonphenolic base, and aurotensine (38 p. p. m.), m. 126–7°, was the only phenolic base pptd. by CO_2. Only I and II were found in *Gl. flavum* by earlier investigators. W. Gordon Rose

Mineral peat in the Altvatergebirge (N. Moravia). J. Holluta, W. Herrmann and F. Neukomm. *Verh. Naturforsch. Ver. Brünn* 69, 1–13(1938); *Neues Jahrb. Mineral., Geol.*, Ref. II, 1939, 840–1.—Detailed analyses and phys. properties of the peat used for the Karlsbrunn baths are given, with similar details of 4 similar peats. C. A. S.

Soap perfuming in relation to odor-carrying alc. group (Ruemele) 27. Control of alimentary and medicinal vitamins in Poland (Truszkowski) 11E. Phenolic compds. from petroleum sources [germicides] (Field, *et al.*) 22. Decompn. and stabilization of H_2O_2 and metal peroxide solns. [for mouthwashes] (Henk) 18. Leaf pigments of tobacco (Nagel) 11D. Prepn. of higher alcs. [for creams] (Webster and Schaefer) 10.

Clear aqueous therapeutic solutions of lipins. Hermann E. Schultze (to Winthrop Chemical Co.). U. S. 2,185,969, Jan. 2. Various details and examples are given of the prepn. of clear solns. suitable for injection, as by a process involving heating 1 part of cholesterol and 3 parts of cholesterol oleate in a physiol. NaCl soln. contg. 6 parts of polyethylene glycol oleyl ether and a small quantity of $CHCl_3$ and subsequently eliminating substantially all the $CHCl_3$, or by a process which comprises heating to about 60° in a closed vessel 1 part of vitamin D, 1 part of triolein, 6 parts of polyethylene glycol oleyl ether, 0.4 part of methylene chloride and 90 parts of physiol. NaCl soln. and subsequently eliminating substantially all the methylene chloride.

Furfuryltrimethylammonium iodide and similar therapeutic compounds. Fred P. Nabenhauer (to Smith, Kline & French Laboratories). U. S. 2,185,220, Jan. 2. Various examples and details are given of the production of *medicinal agents* capable of producing effects simulating those of stimulation of neuromuscular mechanisms under control of the parasympathetic nervous system, and producing physiol. effects qualitatively cholinergic or muscarinic in character and physiol. effects resulting therefrom, the agent comprising as the essential and therapeutically active ingredient thereof a compd. from the group consisting of alkyldimethylammonium salts having the following formula: $RCH_2NMe_2R'X$ in which R is furfuryl or tetrahydrofurfuryl, R' is an alkyl group having 1–5 C atoms, and X is a radical of an acid producing nontoxic ions. Tetrahydrofurfuryltrimethylammonium iodide m. 122–4°.

Medicine for application to mucosal membranes such as those of nose or eye. Gordon A. Alles. U. S. 2,185,824, Jan. 2. A medicinal agent for administration by application to mucosal membranes to stimulate peripheral neuromuscular mechanisms under control of the sympathetic nervous system comprises 1-(*p*-hydroxyphenyl)-2-aminopropane acid tartrate suitably extended by assocn. with an excipient adapting it for application to mucosal membranes, such as water. Cf. *C. A.* **34**, 2139[3].

Globin insulinate, etc. Laszlo Reiner (to Burroughs Wellcome & Co. (U. S. A.) Inc.). Brit. 508,983, July 10, 1939. See U. S. 2,161,198 (*C. A.* **33**, 7495[6]).

***N*-Furfurylmorpholine methiodide, etc.** Fred P. Nabenhauer (to Smith, Kline & French Laboratories). U. S. 2,185,219, Jan. 2. Various details are given of the prepn. of intermediates and final products stimulative to the parasympathetic nervous system, such as *N*-furfuryl morpholine methiodide and other alkyl halides in which the alkyl group is Et, Pr, iso-Pr, Bu and Am groups.

Arsonic acids. Walter Herrmann, Hans Hilmer and Friedrich Hampe (to Winthrop Chemical Co., Inc.). Can. 386,379, Jan. 16, 1940. Arsonic acids having therapeutic properties are prepd. by causing a carbethoxyaminobenzenearsonic acid to react with a hydroalkylamine or melting an asymmetrical aryl- or aminoarylhydroxyalkylurea with arsenic acid or by diazotizing it and treating the diazo compd. with arsenious acid. Several examples are described.

Refining and improving the odor and taste of ethereal oils by fermentation. Willy Ekhard. U. S. 2,184,637, Dec. 26. A process for improving crude terpenes, camphor and peppermint oil or mixts. contg. such crude ethereal oils, involves the steps of emulsifying the substances to be improved with a fermenting culture medium for yeast and bacterial acid formers, subjecting the substances to a biol. fermentation by yeast or bacterial acid formers, and sepg. the substances thus improved from the culture medium after the fermentation. A catalyst such as Sn or Zn and an oxidizing agent such as ozonized air may be used to facilitate the process, as may also ultraviolet rays. A pH of 4 to 7 is suitable.

Isolation of sterols. Russell E. Marker (to Parke, Davis & Co.). Brit. 509,062, July 11, 1939. Pregnanolone compds. are prepd. by (1) treating the carbinol fraction of, e. g., human pregnancy urine, from which phenols and phenolic estrogenic hormones have been removed, with a dibasic org. acid acylating agent to convert the alcs. therein into the corresponding acid monoesters, (2) causing the monoesters to react with a basic or alk. agent to convert them into their H_2O-sol. ester salts, (3) sepg. the salts in aq. soln. from H_2O-insol. impurities by washing out the aq. soln. with H_2O-immiscible org. solvent, (4) converting the sepd. and purified ester salts into their acid monoesters by treatment with acid, (5) sapong. the monoesters to produce a mixt. contg. epiallopregnan-3-ol-20-one (I) and *epipregnan-3-ol-20-one* (II), (6) treating the purified mixt. from (5) with a ketone reagent capable of reacting with the 2 pregnanolones (preferably with a hydrazine (III) compd. capable of forming a H_2O-sol. III deriv. with I) but not with nonketonic alcs., (7) sepg. the mixt. of ketone derivs. of (6) from nonketonic derivs., (8) crystg. out the less-sol. I deriv. from an org. solvent in which the 2 ketone derivs. have different solubilities and sepg. the crystals from the mother liquor, (9) crystg. out the more-sol. II deriv. from the mother liquor of (8), (10) separately regenerating purified I and II from the cryst. products of (8) and (9) and removing the regenerated pregnanolone in each case from the decompn. products of this step. A *new* 3-epipregnanediol is obtained by reduction of the new II; it differs from natural pregnanediol in pregnancy urine by having a different configuration of the OH group at C_{20}. The new II may be oxidized to the corresponding known pregnanedione. The I may be oxidized to the corresponding allopregnanedione compd.

Vitamin B and G concentrate from yeast. Robert F. Light and Charles N. Frey (to Standard Brands Inc.). U. S. 2,184,748, Dec. 26. A process for the prepn. of a vitamin B and G concentrate from yeast comprises plasmolyzing yeast, adjusting the pH of the mass to 5.0 to 6.5, coagulating protein material by adding MeOH, EtOH or EtOAc to a concn. of 50–60% of the mass whereby filterability thereof is increased, filtering and concg. the filtrate so obtained at a temp. not exceeding 75–80°.

Preparation of vitamin B_1. Taizo Matukawa and Masaki Ota (to K. K. Takeda Tyobei Syoten). U. S. 2,184,720, Dec. 26. 2-Methyl-4-amino-5-formaminomethylpyrimidine is treated with γ,γ-diaceto-γ-mercaptopropyl alc. and glacial HOAc contg. HCl (suitably by heating at 100–110° for 2 hrs.) Details of making the initial reacting materials are given, and a cryst. product, m. 245°, is obtained.

***l*-Ascorbic acid.** Richard Pasternack and Gordon O. Cragwall (to Charles Pfizer & Co.). U. S. 2,185,383, Jan. 2. 2-Keto-*l*-gulonic acid and its readily hydrolyzable derivs. such as diacetone-2-keto-*l*-gulonic acid are converted to *l*-ascorbic acid by the combined action of a solvent capable of reacting with the hydroxyl groups of the 2-keto-*l*-gulonic acid, such as glacial HOAc, and a sufficient amt. of concd. HCl or H_2SO_4 to make a soln. of at least twice normal strength. Various details and modifications of procedure are described.

Separation of dihydroequilin and estradiol from mixtures containing them. Schering A.-G. (formerly Kokswerke und Chemische Fabriken A.-G.). Brit. 509,075, July 11, 1939. The mixts. are caused to react with

saponins, e. g., digitonin, and the product or products that have not entered into reaction and the saponin compds. of the products that have entered into reaction are sepd., whereupon, by splitting of the saponin compds., the product(s) contained in the latter are sepd. To sep. estrone and equilin, the mixt. is initially converted by known methods, e. g., with Na and alc., into the corresponding diols; the estradiol only, in fact, the *trans*-estradiol, is pptd. by the reaction with the saponin; the mother liquor contains chiefly the dihydroequilin together with a little *cis*-estradiol, which can be easily removed by crystn.

Hormone preparations of high purity. Erwin Schwenk, Friedrich Hildebrandt and Max Gehrke (to Schering Corp.). U. S. 2,184,775, Dec. 26. Various details of procedure are described, including a method for sepg. germinal hormones from crude oily exts. obtained from the urine of pregnant women contg., among other compds., the follicle hormones $C_{18}H_{22}O_2$, follicle hormone hydrate $C_{18}H_{24}O_3$, the male sex hormones, pregnanediol and allopregnanediol, comprising treating the crude oil with phthalic acid anhydride, distributing the reaction product between ether and an alkali carbonate soln. so as to sep. the same into a salt-forming fraction dissolved in the alkali carbonate soln., and a nonsalt-forming fraction dissolved in the ether saponifying both fractions, extg. the water-dild. saponification liquid of the nonsalt-forming fraction after satn. with CO_2 with ether, treating the ethereal extract with concd. alkali hydroxide soln. and isolating from the alk. soln. obtained a cryst. follicle hormone prepn. contg. the follicle hormone $C_{18}H_{22}O_2$, while the water-dild. saponification soln. of the salt-forming fraction, after satn. with CO_2, is extd. with ether, whereupon the ethereal extract is treated with concd. alkali hydroxide soln., whereby from the alk. soln. obtained the follicle hormone hydrate in a high state of purity is obtained while the remaining ethereal soln. is subjected to fractional crystn., first yielding pregnanediol and allopregnanediol and on complete evapn. to dryness of the ether the male sex hormone in a state of high purity.

Skin-protecting composition. M. I. Khesin. Russ. 56,097, Nov. 30, 1939. The skin is protected from the effects of petroleum products, coal tar, etc., by the use of a mixt. contg. gelatin, glycerol, starch and Al acetate.

Analgesic and vaso-constrictive dusting powder. Reinhard Beutner (to Parke, Davis & Co.). U. S. 2,185,178, Jan. 2. A partially condensed fusible phenol-formaldehyde resin substantially free from the irritating action of free phenol and CH_2O and from which uncombined phenol and CH_2O have been expelled is used in finely powd. form (the resin being one capable of being heated without being converted into the final, infusible state).

Saponaceous shaving composition. Hugo Kröper and Erich Thomae (to Chemische Fabrik Promonta G. m. b. H.). U. S. 2,185,255, Jan. 2. Use is made (suitably with various admixts.) of a hemostatic lipoid-sol. substance derived from soybeans by treating them with petroleum ether, ether, benzine or benzene, adding EtOH or acetone to the resulting soln., and recovering the lipoid-sol. substance from the resulting materials, as by dissolving and repptn.

Hair-dye compositions. Wolf Kritchevsky (to Rit Products Corp.). U. S. 2,185,467, Jan. 2. With an org. dye such as Brown BN, C. I. 422, etc., use is made, as an agent to cause adherence of the dye to the hair, of formamide or other water-sol. compd. having the nucleus RCON= in which R represents H, a lower alkyl, cycloalkyl, aryl, aralkyl, alkylol, aralkylol or derivs.

18—ACIDS, ALKALIES, SALTS AND OTHER HEAVY CHEMICALS

E. M. SYMMES

New acetic anhydride process. G. Benson. *Chem. & Met. Eng.* **47**, 150-1(1940).—AcH is oxidized by air in the presence of a catalyst, such as Co or Mn acetate, and a diluent. Sepn. of diluent and H_2O, excess AcH, AcOH and Ac_2O is accomplished in bubble column stills under vacuum. The reaction is mainly $CH_3CHO + O_2 \rightarrow CH_3COOOH$; $CH_3COOOH + CH_3CHO \rightarrow 2CH_3COOH$. There is also the reaction $CH_3COOH + CH_3CHO \rightarrow (CH_3CO)_2 + H_2O$; $(CH_3CO)_2 + H_2O \rightarrow 2CH_3COOH$. Rapid handling of the products favors fractionation of the Ac_2O. E. M. Symmes

Viscosity of strong phosphoric acids. D. S. David. *Chem. & Met. Eng.* **47**, 155(1940).—A nomograph. G. G.

The nitric oxide process in sulfuric acid manufacture. Hugo Petersen. *Atti X° congr. intern. chim.* **4**, 57–64 (1939) (in German).—A review, mainly of tower processes. E. M. Symmes

The manufacture of sulfuric acid by means of vanadium catalyst on an intermediate scale. II. Increase of the draft-resistance in a small converter. Gohei Osame and Taizo Hirai. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 434(1939).—Vanadium catalyst, fouled by Fe sulfate, is slightly inferior to the uncontaminated catalyst in layers at 425°. H. G. Bowlus

Alumina obtained from thermal decomposition of ammonium alum. P. G. Guseva and A. S. Ivanov. *Trudy Tsentral. Nauch.-Issledovatel. Lab. Kamneĭ Samotsvetov Trudy "Russkie Samotsvety"* **1938**, No. 4, 35–43; *Khim. Referat. Zhur.* **2**, No. 5, 85–6(1939).—Decompn. of NH_4 alum at 1045–1110° gave isotropic γ-Al_2O_3, with admixts. of undecompd. $Al_2(SO_4)_3$ (up to 2.5%). Decompn. at 1155° gave almost exclusively γ-Al_2O_3, but in some isotropic plates of the γ-Al_2O_3 a beginning of the transformation into the hexagonal α-Al_2O_3 was observed. At 1250° even more of the α-Al_2O_3 was found and the admixts. of $Al_2(SO_4)_3$ decreased to 0.76%. The prepn. obtained at 1300° consisted almost wholly of α-Al_2O_3. The normal mixt. for the synthesis of corundum must consist of γ-Al_2O_3. The alum should not be heated above 1130°. W. R. Henn

Continuous carbonation of aluminate solutions. I. N. Prokhnitskiĭ. *Tsvetnye Metal.* **13**, No. 10, 85(1938); *Chimie & industrie* **42**, 282; cf. *C. A.* **33**, 3975[8].—Continuous carbonation of aluminate solns. can be effected by establishing between the carbonators an uninterrupted stream of $Al(OH)_3$ pulp in soda soln. by the principle of the mammoth pump, which can raise the pulp from a lower into a higher container. The operation of such a pump is based on the fact that a column of the pulp contg. air bubbles is lighter than a column of the pulp alone. A. Papineau-Couture

Contact properties of chromium oxide in the oxidation of sulfur dioxide to trioxide. I. E. Adadurov. *J. Applied Chem.* (U. S. S. R.) **10**, 470–1(1937); *Chem. Zentr.* **1938, I**, 4516.—A comment on the paper by the same title by Postnikov, Kunin and Ashtasheva (*C. A.* **31**, 2363[4]). Attention is called to the lack of agreement in the methods there employed for the calcn. of yields and to the existence of nonstable catalysts in their work. M. G. Moore

Automatization of control and regulation in the soda process. B. A. Sass-Tisovskiĭ. *Avtomatika i Telemekhanika* **1938**, No. 4–5, 127–43; *Khim. Referat. Zhur.* **2**, No. 5, 73–4(1939).—After a short description of existing technological processes in the production of soda instructions are given for the modernization of the automatic app. W. R. Henn

Influence of titanium oxide on the sintering of magnesite. III. Temperature-change stability. Yasuo Tanaka and Tomoatu Takagi. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 405–6(1939); cf. *C. A.* **33**, 9558[8].—Compressed magnesite test pieces, contg. 4% Ti oxide, Fe oxide or ilmenite, were sintered at 1200–1600°. The addn. of these materials improved the porosity at the lower burning temps. The amt. of added material was not critical in the region 2–6%. H. G. Bowlus

Ammonium oxalate for use as fertilizer. I. Hygroscopicity of ammonium oxalate monohydrate. Syohei Uno. *Waseda Applied Chem. Soc. Bull.* 17, 1–4, *Abstracts* (in English)36(1940).—The vapor pressure of a satd. soln. of NH_4 oxalate in the range of 15–40° was measured and the following empirical formula for the vapor pressures obtained: $\log p$ (mm.) $= -(2282/T) + 9.0265$. $(NH_4)_2C_2O_4.H_2O$ is less hygroscopic than K_2SO_4, Ca superphosphate and KNO_3. II. **The double decomposition between sodium oxalate and barium hydroxide in the preparation of ammonium oxalate.** *Ibid.* 5–12, *Abstracts* (in English) 37.—The reaction between $Na_2C_2O_4$ and $Ba(OH)_2$ was studied in the course of prepn. of $(NH_4)_2C_2O_4$ from CO by reaction with NaOH, decompn. of the NaO_2CH formed to H_2 and $Na_2C_2O_4$, treating the latter with $Ba(OH)_2$ to give NaOH, which is used again, and BaC_2O_4 which is treated with $(NH_4)_2CO_3$ to give the desired product and $BaCO_3$ which is decompd. to Ba(OH) and used again. The reaction between $Na_2C_2O_4$ and $Ba(OH)_2$ proceeded very rapidly and yielded more than 99.7% BaC_2O_4. More concd. NaOH was recovered than that obtained in the caustification of Na_2CO_3 with $Ca(OH)_2$. A very slight excess of $Ba(OH)_2$ was necessary in the reaction. The ppt. of BaC_2O_4 produced at the high temp. was easily filterable. C. L. B.

Barium chloride from barite and calcium chloride. Factors affecting production. R. Norris Shreve and R. K. Toner. *Ind. Eng. Chem.* 32, 568–73(1940); cf. *C. A.* 30, 8321[9]; 33, 7966[8].—The reaction $BaSO_4 + CaCl_2 = BaCl_2 + CaSO_4$ was examd. in concd., aq. solns. at 175° and in fusion. The reaction has a true equil. in each case. In aq. soln. a reaction time of 6–12 hrs., in the presence of sufficient $CaCl_2$ to form a satd. soln., gives large, practicable conversion to $BaCl_2$. In fusions, time and temp. have no appreciable effect on conversion. Aq. MeOH is a satisfactory extn. solvent if insol. type of barite is formed, otherwise anhyd., org. solvent must be used to ext. $BaCl_2$ from the reaction mass. E. M. Symmes

Purification of brine intended for electrolysis. E. Salvatore. *Atti X° congr. intern. chim.* 4, 64–70(1939).—Addn. of CaO, then Na_2CO_3, purifies brines better than Na_2CO_3 alone. E. M. Symmes

Calcining of coarsely crystalline calcite. J. J. Frankel. *Minerals Research Lab. S. Africa Bull.* No. 2, 11 pp. (1937); *Ceram. Abstracts* 19, 76.—The thermal decompn. of coarsely cryst. calcite was studied in an app. made by F. Subsequent tests were made in a Herresoff lab. furnace and a kiln designed by F. The decrepitation of calcite is discussed. Analyses are given of ores used and the cost or erection of the kiln is given. C. L. B.

New method for technical chalk production. A. I. Ivanov, B. V. Fabritsiev and A. I. Kolomytseva. *Trans. All-Union Sci. Research Inst. Econ. Mineral.* No. 117, 7–53(in English, 54)(1936).—A description is given of the commercially developed chalk deposits in the Soviet Union, including petrographic study, technology of dressing, methods of testing. The Inst. of Econ. Mineral. has developed a method for the flotation of chalk. The solid: liquid ratio was 1:4. The most effective flotation agents were carboxylic acids and naphthenic acid soaps, with yields of the concentrates ranging up to 99.12% and 98.40%, resp. At temps. below 20° the efficiency of flotation decreases and the consumption of reagents increases. An increase in temp. above 20° has no practical results. As regards the activity of the chalk in rubber mixts. it was found that carboxylic, stearic and palmitic acids give the greatest activation. The reagent consumption should not exceed 0.3 kg./ton. The chalk obtained by flotation was satisfactory as a rubber filler. B. Z. Kamich

Iron perchlorate. Folke Linstrand. *Separate, A.-B. Gleerupska Univ.-Bokhandeln, Lund,* 1939, 103 pp.—A review. 109 references. R. D. Deese

Kaolin industry in the Soviet Union and standardization of its products. V. P. Aleksandrov, A. E. Voitsekhovskii and V. I. Luchitskii. *Trans. All-Union Sci. Research Inst. Econ. Mineral.* No. 126, 5–154(1938).—A review of the present status of the kaolin industry in the Soviet Union is followed by a description of the properties of Ukrainian, Siberian and Ural kaolins. The kaolins of the chief Ukrainian deposits are considered of equal quality to the best foreign grades. Standards are discussed for kaolin to be used in porcelain, paper, rubber, perfume, soap and refractory industries. Forty-eight references. B. Z. Kamich

Alkali slurry for carbon dioxide recovery. Gustave T. Reich. *Chem. & Met. Eng.* 47, 152–5(1940).—A satd. soln. of alkali bicarbonate and alkali carbonate is carbonated to produce a soln. contg. solid alkali bicarbonate in suspension. The suspended alkali bicarbonate is then dissocd. to alkali carbonate and CO_2 by heat; this leaves a soln. still satd. with bicarbonate. CO_2 is recovered more efficiently, with lower heat expenditure and less heating surface, than by known absorption processes. E. M. Symmes

Decomposition and stabilization of hydrogen peroxide and metal peroxide solutions. Hans-Joachim Henk. *Seifensieder-Ztg.* 67, 75–6(1940).—Decompn. of peroxides is catalyzed by salts or oxides of Cu, Fe, Pb, Hg, Co, Ni and Mn. Decompn. is restricted by H ions, especially by 0.1% H_3PO_4 or H_2SO_4. The most applicable stabilizers include Mg, Ca, Sn^{++} and Sn^{++++} compds., such as phosphates. Mono and secondary phosphates, alkali pyrophosphates plus salicylic acid, Na benzoate and Me *p*-hydroxybenzoate are effective also. The activity of pos. catalysts can be restricted by addn. of capillary-active materials, which are adsorbed by the catalysts in preference to the peroxides. These include alcs., ketones and org. series including uric acid, barbituric acid and the methanes. Urea is valueless. Thio- and phenyl-ureas are better. Phenol derivs. including phenacetin, Et ether of acetyl-*p*-aminophenol, acetanilide, aniline, NH_4CNS, K bromodioxalate and NH_2OH are effective. For *mouth washes*, acetic or citric acids, or Mg and Ca bicarbonates are usable. For bleaches, both anticatalyst and a capillary-active material should be used. A. Guillaudeu

Rapid extraction of free sulfur from antimony sulfide. Herbert C. Haller. *Chemist-Analyst* 29, 11(1940).—Simplified directions are given for boiling the sample with Me_2O under a reflux condenser. W. T. H.

Utilization of the pyrite waste products in Karabash. N. M. Nikolich. *Tsvetnye Metal.* 1938, No. 11, 49–52; *Khim. Referat. Zhur.* 2, No. 5, 75–6(1939).—Utilization of pyrite tailings contg. 8–40% of S is described. They can be floated in the presence of 0.115 kg./ton of $CuSO_4$, 0.013 kg./ton of the tank residues and 0.12 kg./ton of xanthene. The extn. of S was not less than 85% and its content in the concentrate was 40–2%. W. R. Henn

Nonmetallic minerals. Kenneth E. Hickok. *Mines Mag.* (Colo. School of Mines) 30, 65–6, 74(1940).—Over 70 different nonmetallic minerals are being produced commercially. They include naturally occurring minerals of submetallic or earthy luster, which cannot be plastically deformed, are poor conductors of heat and electricity and are used industrially without conversion to a metallic constituent of the mineral. Applications are described of natural abrasives, asbestos, barite, bauxite, borax, cement materials, chalk, chromite, clays, gem stones, graphite, limestone, Li minerals, magnesite, Mn minerals, mica, nitrates, phosphates, potash, pumicite, NaCl, sand and gravel, sillimanite, S, talc and Ti minerals. L. S.

Alunite. VI. Yahei Asada. *Bull. Inst. Phys. Chem. Research* (Tokyo) 17, 1300–68(1938); cf. *C. A.* 33, 4502[8].—The thermal decompn. of $K_2SO_4.Al_2(SO_4)_3.24H_2O$ and of $Al_2(SO_4)_3$ was investigated. B. C. P. A.

Certain physical and chemical factors influencing the activity of charcoal. VII. E. V. Alekseevskii and I. N. Semenov. *J. Gen. Chem.* (U. S. S. R.) 9, 1577–85(1939); cf. *C. A.* 29, 6372[8].—Extensive expts. in activation of charcoal and several kinds of bituminous coal by extn. with various solvents are described. Charcoal was extd. by refluxing it in a solvent for 9 hrs. and drying the residue *in vacuo* at 450°. Bituminous coals were extd. in the Soxhlet app. and in an autoclave at 225–60° and 45–50 H atm. for 6 hrs., followed by extn. in the Soxhlet app. and vacuum-drying at 300°. The treated and untreated C

products were tested for adsorptive capacity for $CH_4 + N$ vapor and for H_2O_2, AcOH, I, PhOH and other products in aq. solns. Tabulated results show that the adsorptive power of extd. charcoal is considerably increased. The most active solvents are EtOH, MeOH, CCl_4, Me_2CO, AcOEt, $PhNO_2$, $PhNH_2$ and naphtha. The adsorptive capacity of extd. bituminous coals is increased comparatively little (up to 10%). The best solvents are Me_2CO, EtOH, CCl_4, CS_2 and $C_2H_4Cl_2$. The resulting C products show poor mech. strength. Fifty references. C. B.

Activation and clarifying properties of fuller's earth. VI. Adsorption of coloring matter by fuller's earth in decolorizing oils. B. S. Kulkarni and S. K. K. Jatkar. *Kolloid-Z.* 89, 54–9; *J. Indian Inst. Sci.* 22A, 331–40 (1939); cf. *C. A.* 33, 4746⁸.—Three Jodhpur earths, a local earth and an earth designated as pure, were tested by decolorization of acid-free safflower oil having a Lovibond color value of 16.7 yellow. The earths were previously activated by digestion in HCl and were sieved to 100 mesh. In 4 series of expts. earth equal to 1, 2, 3 and 5% of the wt. of the oil was heated in the oil for 15 min. at 90–95° with stirring, then filtered hot. In another series of expts. the color concn. of the oil was varied and the earth concn. kept const. at 1%. The data thus obtained were tested on the Freundlich isotherm equation: $\text{Log } x = n \log c + \log a + \log m$ in which x is the percentage of color removed, c the percentage remaining, m the wt. % of earth used and a and n are consts. The color removed by the highly active Jodhpur earth was not proportional to the wt., but for the less active used earths in lower proportions, was proportional. The relation between log c and log x was clearly not linear in the lower and higher concns. and the curve was more pronounced for some earths than for others. Phys. adsorption appears to predominate at low color concns. and chem. chiefly at higher. The requirements of the Freundlich isotherm are not fulfilled, part of the color apparently being removed by a definite chem. combination with exchangeable H of the earth.

A. Lloyd Taylor

Coal and ore in Sudetenland [graphite of Böhmerwald] (Heugel) 21. Developments in dispersion of C black (Venuto) 26. Geol. features of deposits of bleaching clay (Schroter, Campbell) 8. Clays and fuller's earths (Schwarz) 9.

Aall, Ch.: Contribution à l'étude du carbure de calcium industriel. Paris: H. Dunod. 179 pp. Fr. 48 plus 3%.

Kopp, H. Fr.: Der deutsche Marmor. Munich: Pohl. 48 pp. M. 2.50.

Nitric acid. Herman A. Beekhuis, Jr. (to Solvay Process Co.). U. S. 2,185,579, Jan. 2. NO_2 is treated with an aq. liquid in the presence of Cl, with the formation of HNO_3 and NOCl; the NOCl is oxidized with O to form NO_2 and Cl, and the products of this oxidation, together with addnl. NO_2, are caused to react with aq. liquid to form HNO_3. An arrangement of app. and various details of operation are described. U. S. 2,185,580 describes app., and a process for the production of concd. HNO_3 by treating NO_2 and an aq. HNO_3 contg. about 70% or more HNO_3 to form a HNO_3 contg. an increased proportion of HNO_3 to H_2O; this comprises treating the NO_2 and aq. HNO_3 in a reaction mixt. contg. concns. of NO_2 and HNO_3 for which the equil. partial pressure of NO is below 0.01 atm., contg. free Cl in amt. sufficient to reduce the partial pressure of NO of the reaction mixt. to below the equil. partial pressure and contg. the Cl, NO_2 and H_2O and HNO_3 in the aq. HNO_3 in proportions resulting in the formation of a HNO_3 contg. dissolved therein more than 0.5% total Cl (calculated as HCl).

Nitric acid. L. V. Saradzhev. Russ. 55,902, Oct. 31, 1939. In the manuf. of HNO_3 from NH_3 the processes of cooling, oxidation and absorption of nitrous gases are carried out at pressures in excess of 200 atm.

Phosphoric acid. O. D. Kashkarov. Russ. 52,336, Dec. 31, 1937. A mixt. of phosphorite, coal and silica is chlorinated at high temp. in the presence of chlorides of Si, Fe and Al. $POCl_3$ is sepd. by fractionation and converted to H_3PO_4.

Pressure synthesis of sulfuric acid. Ernst Berl. U. S. 2,184,707, Dec. 26. App. is described, and a method which involves treating a soln. of nitrosylsulfuric acid in H_2SO_4 with roast gases contg. SO_2 at a pressure of about 30–50 atm. to cause an absorption of the SO_2 in the soln., whereby oxidation of the SO_2 by the nitrosylsulfuric acid occurs in the liquid phase.

Concentration of sulfur dioxide. Z. P. Rozenknop and I. N. Shokin. Russ. 51,942, Nov. 30, 1937. Gases contg. SO_2 are mixed with NH_3 generated by heating $(NH_4)_2SO_4$. The mixt. of SO_2 and NH_3 is washed with a soln. of $(NH_4)_2SO_3$ and NH_4HSO_3 and the concd. soln. of sulfites thus obtained is treated with NH_4HSO_4 formed in the generation of NH_3 from $(NH_4)_2SO_4$.

Alkalies. Ya. M. Pesin. Russ. 55,943, Oct. 31, 1939. Alkali permutite is treated with a soln. of NH_4OH and the NH_4 permutite is regenerated by known methods by means of the chloride of the corresponding alkali metal.

Compounds of thorium and cerium. G. P. Aleksandrov and G. O. Byk. Russ. 55,894, Oct. 31, 1939. Nitrates of the rare earth metals are boiled in the presence of marble, the ppt. obtained is dissolved in HNO_3, the soln. treated with a reducing agent, and again boiled in the presence of marble, the ppt. of basic Th nitrate is filtered, and Ce obtained from the soln. in known manner.

Aluminum hydroxide. Carlo Toniolo and Azogeno Soc. anon. Brit. 508,911, July 7, 1939. $Al(OH)_3$ is produced in a form readily separable from the substances with which it is mixed by causing a sufficiently pure H_2O-sol. simple or double, or mixed simple and (or) double, Al salt or salts in a solid comminuted form to react with 1 or more powd. alkali metal or NH_4 carbonates, bicarbonates or carbamates to produce a mixt. comprising meal-like $Al(OH)_3$ and an alkali salt or salts other than carbonates, bicarbonates or carbamates. The $Al(OH)_3$ may be sepd. by lixiviation and converted to Al_2O_3 by calcination.

Recovery of ammonia from used cuprammonium rayon precipitation liquors. Alfred Haltmeier (to I. G. Farbenind. A.-G.). U. S. 2,184,923, Dec. 26. An arrangement of app. is described, and a process of recovering NH_3 and heat from used cuprammonium rayon pptn. liquors, which comprises bringing the warm liquors with substantially the temp. they have when coming from the pptn. treatment into countercurrent contact with a current of steam having a pressure corresponding substantially to the pressure of satd. steam at a temp. equal to the temp. of the liquors, at least a part of the steam being obtained by evapn. of the still warm pptn. liquors after the countercurrent treatment at a pressure lower than that of the steam employed for the countercurrent treatment of the pptn. liquors and compressing the part of the steam to the pressure employed for the countercurrent treatment, introducing the compressed steam into the countercurrent app. and removing the NH_3 and the steam carrying the NH_3 and condensing the NH_3 and the steam together.

Recovery of metals and ammonia from ammoniacal metal salt solutions. Karl Pattock and Hans Wassenegger (to I. G. Farbenind. A.-G.). U. S. 2,184,943, Dec. 26. A process of recovering metals and NH_3 from highly dild. aq. ammoniacal solns. involves passing the solns. through a plurality of filters contg. a granular water-insol. resin of the group consisting of condensation products of a polyhydric phenol and CH_2O and condensation products of a phenol and CH_2O, contg. sulfonic acid radicals, interrupting the filtration when satn. of the first filter with metal ions occurs, and sepg. the metal from the filter by regenerating it with an acid which forms sol. salts of the metal.

Oxidation of ammonia. Ralph S. Richardson (to Chemical Construction Corp.). U. S. 2,185,607, Jan. 2. In the production of oxides of N by the catalytic oxidation of NH_3, a method of starting the process comprises passing a stream of air through a catalyst gauze, then injecting hot combustion gases other than the gases resulting from the combustion of NH_3 into the stream of air, then passing the resulting hot gas mixt. in heat-exchange relation with an earlier portion of the air stream to preheat the latter

and finally, when the catalyst gauze is heated to ignition temps., vaporizing NH_3 into the air stream in advance of the heat-exchange step. App. is described.

Crystalline boric oxide. Leon McCulloch (to Westinghouse Elec. & Mfg. Co.). U. S. 2,186,257, Jan. 9. A cryst. boric oxide m. about 460–470° and having a d. about 2.42 is produced by a described treatment from boric acid. Cf. *C. A.* 33, 1454[6].

Inhibiting oxidation of cuprous oxide. Loren C. Hurd (to Röhm & Haas Co.). U. S. 2,184,617, Dec. 26. Finely divided Cu_2O has its particles coated with a thin layer of protein material, such as glue or gelatin or egg albumin.

Lead arsenate from arsenic acid and lead-oxygen compounds such as lead oxide. James W. Swaine (to General Chemical Co.). U. S. 2,184,890, Dec. 26. A Pb-O compd. and arsenic acid are continuously fed into a reaction zone which may contain HOAc soln. and Pb acetate for reaction in an initial reaction phase to form Pb arsenate, while the feed of materials is regulated so as to maintain an excess of the Pb compd., while minor portions of the reacting ingredients are fed, and remaining major portions of the reacting materials are then fed into the reaction mass, with use of an excess of arsenic acid, for a second phase and completion of the reaction. Cf. *C. A.* 34, 1827[1].

Magnesium fluosilicate. A. G. Pavlovich-Volkovyskiĭ and I. I. Zaring. Russ. 56,096, Nov. 30, 1939. F-contg. gases obtained in the acid treatment of phosphorites and apatite are treated with an aq. suspension of $MgCO_3$ or $MgCl_2$.

Magnesium hydroxide. A. A. Shikin and N. S. Spiro. Russ. 51,980, Nov. 30, 1937. A soln. of the Mg salt is treated with lime in the presence of tanning ext. to accelerate the settling, filtration and washing of the $Mg(OH)_2$.

Activated silica. A. A. Chizhik and V. Ya. Ketkovich. Russ. 55,548, Oct. 31, 1939. A product suitable as an active filler for rubber mixts. is prepd. by the interaction of H_2SiF_6 and NH_3, washing the product free of F ions, and treatment with weak soln. of alkali.

Sodium bicarbonate crystals. K. F. Pavlov. Russ. 52,168, Nov. 30, 1937. Large crystals of $NaHCO_3$ are obtained by inoculation with $NaHCO_3$ crystals in the carbonation tower.

Removing iron and arsenic from stibnite. G. K. Rebrov. Russ. 55,942, Oct. 31, 1939. The above stibnite is fused with a mixt. of Na_2SO_4, Na_2SO_3 and quartz sand in an oxidizing atom.

Apparatus for continuous sorption of iodine from well waters by means of activated carbon. T. T. Filippos'yants. Russ. 56,132, Nov. 30, 1939. Construction details.

Nitrogen-hydrogen mixture. V. M. Alekseevskiĭ and A. I. Morozov. Russ. 52,280, Dec. 31, 1937. Producer gas is compressed to 10–20 atm. and cooled to −45° before introduction into the scrubber, first by heat exchange with the finished N_2-H_2 mixt. and then in two stages by evapn. of the liquid CO obtained in the scrubber.

Combined manufacture of yellow phosphorus and power gas. I. S. Rozenkrants. Russ. 55,908 Oct., 31, 1939. **Phosphorites are reduced in a blast furnace operated with oxygen and peat coke.** The peat coke is obtained by low-temp. carbonization of peat in a current of gas composed of blast-furnace gas freed in a known manner of P vapors and low-temp.-carbonization gas freed of tar vapors and preheated in heat recuperators.

Combined manufacture of yellow phosphorus and power gas. I. S. Rozenkrants. Russ. 56,046, Nov. 30, 1939. Addn. to Russ. 55,908 (preceding abstr.). The low-temp. carbonization of peat is carried out with an admixt. of phosphorites.

Utilizing the heat of furnace gases obtained in the vaporization of phosphorus. E. I. Dunaevskiĭ. Russ. 56,122, Nov. 30, 1939. The heat of the furnace gases contg. P is used in preheating the reducing agent (coke), together with a part of the phosphorite and the flux, while the flue gases are used in a common or in individual heat exchangers to heat the basic mass of the components of the mixt. free of C. Russ. 56,123, addn. to the above, Nov. 30, 1939. The entire charge, or part of it, is heated by an external heat source, e. g., producer gases.

Removing acetylene from oxygen. I. G. Malkiel. Russ. 52,207, Nov. 30, 1937. A liquefied mixt. of the two gases is passed through activated carbon.

Cryolite. G. S. Morozov. Russ. 56,000, Nov. 30, 1939. Cryolite is prepd. by treating basic Al fluoride with a soln. of NaOH, sepg. the ppt. of $Fe(OH)_3$ and pptg. the cryolite by known methods from the soln. contg. NaF and $Na_2Al_2O_4$.

Concentrating phosphatic minerals such as Florida phosphates. Oliver C. Ralston (to the Government of the U. S., represented by the Secretary of the Interior). U. S. 2,185,224, Jan. 2. A pulp of the ore is agitated with 2–5 lb. per ton of a cationic compd. of short-chain amino type with substituents contg. 2–5 C atoms, by which clay present is made water repellent, such as diamylamine, and the pulp is treated in an aq. suspension process to remove the filmed clay; the resulting tailing is agitated with a mineral oil and a cationic substituted ammonium compd. with 1 to 4 substituents carrying over 12 C atoms, such as laurylamine, in the presence of an Fe or Al salt, by which quartz particles are made water repellent, and there is sepd. from the pulp a material relatively rich in siliceous gang and relatively poor in phosphate values as a concentrate, and the tailing is collected as a relatively rich phosphate.

Acid decomposition of phosphorites. G. A. Yakovkin. Russ. 55,832, Oct. 31, 1939. The aq. or H_2SO_4 suspension of phosphorite is treated with a mixt. of SO_2 gas and N oxides are introduced in amts. sufficient for the formation of an amt. of H_2SO_4 equiv. to the H_3PO_4.

Catalysts for the removal of organic sulfur from gases. A. V. Avdeev. Russ. 52,333, Dec. 31, 1937. The catalyst is prepd. from a mixt. of slag cement with ferrous bauxite and the addn. of small amts. of powd. metallic Al, which produces pore-forming H_2.

Iron catalyst for ammonia synthesis. S. S. Lachinov and V. G. Telegin. Russ. 52,384, Dec. 31, 1937. Reducing gases are passed through a mass of oxide at a vol. velocity not less than 4000 with stepwise increase of temp. from 375° to 500°.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Developing Canada's nephelite syenite—a review. C. M. Nicholson. *Can. Mining J.* 61, 135–46(1940).—Lakefield nephelite is desirable for introducing Al_2O_3 into glass batches because it is high in Al_2O_3 (24%), high in alkalies (Na_2O 10 and K_2O 5%), low in SiO_2 (no free quartz), low in Fe oxide (0.06%), and excellent in its Na_2O:K_2O ratio. W. H. Boynton

Volcanic rocks as raw materials in glass manufacture. Z. Schaefer. *Sklarské Rozhledy* 16, 72–6(1939); *Chimie & industrie* 42, 840; cf. *C. A.* 33, 7059[9], 7062[8].—Phonolite glasses have a high Al_2O_3 content and consequently a high viscosity. As phonolites contain large proportions of alkalies, their uses permit large savings of Na carbonate or sulfate. The fused glasses obtained are of good quality and resistant to washing; they are suitable for the manuf. of colored bottles. Glasses made from Russian nephelitic syenites also have a high viscosity. Addn. of limestone favorably influences this property. The proportion of Na carbonate or sulfate to sand should be 25–30%.

A. Papineau-Couture

Concentration of sand used in glass melting. A. M. Tsekhomskiĭ and S. E. Fridman. *Steklonaya Prom.* 15,

No. 8–9, 16–18(1939).—An analysis of the chem. compn. of the chief Russian sand deposits is given. Methods of concentrating, such as by magnetic sepn., and washing, are mentioned. M. V. Condoide

Lengthening the life of glass-melting pots. Semenov. *Stekolnaya Prom.* **15**, No. 1, 18(1939).—The usual life of glass-melting pots made from Druzhkovskiĭ clays is about 25 to 30 melts. In order to lengthen this to 40 or 50 melts without lowering the qualities of glass, special precautions should be taken while the glass is being melted. Very often the temp. of the furnace is raised unnecessarily high. This cannot exceed 1500° with new pots and 1470 or 1480° with older pots. The max. temp. of 1500° should not last more than 30 or 40 min. During cooling, the temps. previously detd. should not be exceeded. M. V. Condoide

Production of cast plate glass. A. D. Bardenko. *Stekolnaya Prom.* **15**, No. 8–9, 13–15(1939).—Different defects occurring in cast plate glass are due mostly to irregular cooling between the time of casting and annealing. M. V. Condoide

Permissible rate of cooling glass when annealing. A. N. Dauval'ter. *Stekolnaya Prom.* **15**, No. 11, 28–31 (1939).—The formulas of Murgatroyd (*C. A.* **24**, 2564) used in computations of glass annealing are analyzed and criticized. M. V. Condoide

Cooling of glass. Milota Fanderlík. *Sklářské Rozhledy* **16**, 128–30(1939); *Chem. Zentr.* **1939, II**, 4305.—Deformation during cooling produces lasting inner strains if the cooling is rapid. These deformations may be removed only in a definite temp. range, "the cooling interval." The increase of the temp. by 10° within this range means doubling the cooling time for tech. glasses. The cooling time increases approx. with the square of the thickness of the wall of the article. M. V. Condoide

Decreasing the alkali content and increasing chemical stability of sheet glass produced according to the Fourcault method. S. Ya. Raf and I. E Shapiro. *Stekolnaya Prom.* **15**, No. 10, 15–21(1939).—The introduction of Al_2O_3 in the form of sifted refractory clay and in an amt. of about 0.8% does not complicate the melting and working of glass. No addnl. defects related to the use of clay (streaks or stones) were observed; the qual. indexes remained unchanged. The melting of glass of the compn. SiO_2 71.7, Al_2O_3 1.8, Fe_2O_3 0.1, CaO 8.5, MgO 3.5, SO_3 0.4 and Na_2O 14.0% and the addn. of 10% Na_2O in the form of sulfate proceeds normally. This glass possesses good working properties. It does not tend to crystallize more than the glass of the old compn. which contained 15% Na_2O. Chem. stability of this glass is higher than that contg. 15–15.2% Na_2O. M. V. Condoide

Antimony ruby glass. P. B. Bukarinova and A. A. Kefeli. *Stekolnaya Prom.* **15**, No. 8–9, 28–31(1939).—Soda lime glasses are satisfactory for the production of antimony ruby. The optimum concentrates of Sb, S and C are: (*a*) with 1.5% Sb_2O_3, 0.15–1.5% S and 1.25–0.15% C; (*b*) with 3% Sb_2O_3, 0.50–1.5% S and 1.5–0.5% C. Soda lime glasses contg. 0.5% Sb are not suitable for obtaining antimony ruby as they are very dark and are little permeable to visible light. With the introduction of small amts. of S and C, glasses remain yellow; with larger concns. they become dark and little permeable. The rubies produced are in the majority of cases dark red. Curves of spectral absorption of the visible part of the spectrum have a gentle slope, which fact distinguishes them from selenium ruby; however, they have a great similarity to those of copper ruby. Antimony ruby can be used as decorative and signal red glass. Zinc glasses are unsuitable for antimony ruby because Zn combines with S during melting and forms a compd. which is too stable. M. V. Condoide

Structure and optical properties of iridescent glass. C. V. Raman and V. S. Rajagopalan. *Proc. Indian Acad. Sci.* **9, A**, 371–81(1939); *Chem. Zentr.* **1939, II**, 2576.—On the basis of observations of numerous tests and 30 photomicrographs, 6 optical types of glass decompn. are distinguished: (1) pores with step-like walls; (2) iridescent layers of different colors without visible boundaries; (3) multicolored coats with sharply defined limits; (4) coats with undissolved or incompletely dissolved structures dispersing light; (5) porous coats; (6) dark spots which do not disperse or reflect light. The colors of decomposed glasses are more evident when covered by a liquid. They are even visible when the liquids have the same *n* as the coats. M. V. Condoide

Improving qualities of Fourcault debiteuse. M. S. Kazanskiĭ and V. I. Orzhevskiĭ. *Stekolnaya Prom.* **15**, No. 8–9, 5–13(1939).—A general discussion of the necessity of improving the compn., production and constructional details of Fourcault debiteuse. M. V. C.

Stones in glass. M. Fanderlík. *Sklářské Rozhledy* **16**, No. 6, 105–12(1939); *Chem. Zentr.* **1939, II**, 2958.—These defects are accounted for by difficultly fusible parts of the batch, refractories from the furnace and devitrifications. They are recognized by microscopical or chem. means. A table showing the type, origin and character of those defects is given. M. V. Condoide

Conductometric method of determining chemical stability of glasses. G. G. Samartsev and V. S. Molchanov. *Optiko-Mekhan. Prom.* **9**, No. 8, 7–13(1939).—The conductometric method developed by Kohlrausch (*Wied. Ann.* **44**, 577 (1891)) was somewhat modified and used in the present expts. with good results. Distd. water and a 0.001 *N* HCl soln. were used for the expts. The general conclusion is that the quantity of acid, neutralized by glass at a given time, increases with increased content of metallic oxides in the glass and with decreased silica content. It is important to note that acids destroy glass to a greater depth than water. Difficultly sol. metallic oxides, besides SiO_2, increase the protection of glass in water, but when in an acid soln., these oxides are dissolved and the protective layer is composed of colloidal silica. For a practical characterization of the chem. stability of glass it is important to det. not only the depth of destruction for a given moment of time but also the rate of increase of this depth. M. V. Condoide

Accelerated methods of chemical control in the glass industry. O. V. Krasnovskiĭ. *Stekolnaya Prom.* **15**, No. 7, 29–30(1939).—The accelerated analysis of glass is based on the detn. of SiO_2 and total oxides of Al and Fe from one sample, CaO from another sample, and MgO and total oxides of Na and K from the 3rd sample. Several persons may work together. (1) SiO_2 is sepd. from glass by melting it with NaOH at 480 or 500°. The melt is dissolved with strong HNO_3 and then dried. Surplus HNO_3 is removed. The dry sediment is treated with NH_4NO_3 and filtered, washed and calcined. An acid reaction is present, so that the silica is free from impurities. The total quantities of the oxides of Al and Fe are detd. in the silica filtrate by sepg. Al and Fe in the form of hydroxides with ammonia and purifying the remnants of oxides as usual. (2) Ca detn.: Glass is dissolved with HF and oxalic acid. With repeated oxalic acid treatment of the residue, fluorine is removed and fluorides are changed into oxalates. The residue is washed and treated with AcOH, the oxalates are removed. The residue contains Ca oxalate, which is sepd., calcined, treated with H_2SO_4 to change it into sulfate from which Ca is detd. (3) Detn. of MgO and Na_2O and K_2O: Glass is dissolved with HF and the residue is removed by H_2SO_4. Calcining will change sulfates of Al and Fe into oxides. The residue is treated with water. Al and Fe are sepd. as hydroxides. They are sepd. by ammonia in the presence of ammonia and AcOH. Ca is sepd. in the form of carbonates. The residue is filtered and Mg is sepd. in the form of a double salt of $MgCO_3$ (method of Shafgost). The residue is calcined and Mg is detd. as oxide. The dry filtrate of ammonium and Mg carbonates is calcined and the sulfates of K and Na are obtained. An accelerated chem. analysis of the chief glass-forming raw materials has been developed also. M. V. Condoide

Purifying effect of cullet containing arsenic and antimony. I. M. Prok and L. B. Polyakova. *Optiko-Mekhan. Prom.* **9**, No. 10, 1–7(1939).—Arsenic and Sb present in cullet completely preserve their purifying effects. These properties are observed in the temp. range which promotes the

dissocn. of As_2O_5 and Sb_2O_5 and the sepn. of oxygen. It is possible to replace the poisonous As_2O_3 by a nonpoisonous siliceous As melt. A method of purifying is suggested, based on the introduction of As and Sb not into the batch in the form of trioxides of As and Sb, but directly into the batch in the form of glass of a similar compn. rich in As and Sb. The introduction of such a concentrate changes the compn. of bubbles in the glass mass, enriching them with oxygen, increasing the sizes of bubbles and hence promoting their elimination from the melt. Such a change of bubble compn. shows the chem. effect of the fining agents used, as contrasted with the phys. effect produced by the "bubbling" lumps of As. The behavior of trioxides of As and Sb is not always identical in different glasses. An As concentrate purifies the borosilicate glass L-14 better than the flint glass L-8. M. V. Condoide

Properties of cords and methods of recognizing them. M. A. Bezborodov. *Stekolnaya Prom.* 15, No. 10, 25–32 (1939).—Cords are glass-like inclusions in glass and differ from it in chem. compn. and phys. properties, chief of which is the refraction of light. They are caused by a no. of factors, such as: (1) changes in the glass surface because of the evapn. of some components at high temps.; (2) the introduction of cullet of unsuitable compn.; (3) incomplete diffusion which depends upon viscosity of silicate melts. There are surface and inner cords. Methods used for recognizing cords are briefly discussed. M. V. Condoide

Significance of impurities in coal in the glass industry. *United Glass Bottle Manufrs., Ltd., Combustion Appliance Makers' Assoc.* (*Solid Fuel*), Apr., 1939, 4 pp.(preprint).—The injurious effects of Fe and S on glass quality are discussed. Serious trouble is avoided if the coal employed contains less than 1% of total S. B. C. P. A.

Temperature regulation in glass and enamel furnaces. Otto Th. Koritnig. *Glashütte* 69, 833–5(1939).—K. explains the construction and adjustment of different types of temp. regulators, time-temp. and "program" regulators, etc., and their operation. M. V. Condoide

Trends and developments in ceramic wares for industrial use. J. Gordon Adderson. *Pacific Pulp Paper Ind.* 13, No. 10, 17–19(1939). A. Papineau-Couture

Pebbles for pot mills. Zirokiti Kumazawa. *J. Japan. Ceram. Assoc.* 47, 202–4(1939).—In Japan, larger pebble mills are lined with slabs of Korean hard quartzite, porcelain or granite, preference being in the order given. Agate pebbles are most resistant to abrasion, Ataka flint is next, porcelain pebbles are least. S. Kondo

Apparatus for determination of air in ceramic masses. S. V. Glebov and A. K. Karklit. *Ogneupory* 7, 492–4 (1939).—A sample of known vol. is introduced into the app., the air is forced out by petroleum, petroleum is forced out by hot water and the sample is washed with hot water *in vacuo;* readings are taken in a connected buret. The device can be used to det. the extent of deaeration of plastic and semidry masses. E. E. S.

Ceramic properties and slag-resistance of dunite masses. A. S. Bazilevich. *Ogneupory* 7, 373–82(1939).—MgO reacts only with the fine-grained part of the batch; the reaction product serves as a binder for unchanged dunite grains. With different dunites, the highest refractoriness and resistance to slags are attained by the addn. of 20% magnesite; a further addn. of magnesite has but slight effect. To reduce porosity, dunite ware should be fired at 1600–1650°. The stability of pure dunite to open-hearth slag is low. With a 20% magnesite addn. the stability is higher than that of grog and SiO_2 ware, but lower than that of magnesite and chromite. E. E. S.

Producing keramsite globules in a rotatory kiln. S. P. Loginov. *Keramika* 1939, No. 5, 56–9: cf. *C. A.* 33, 7508⁹.—Clays with low Fe content, that swell in the batch, can be used with Fe addns. (Fe oxide, limonite, flue dust, roasted pyrites, etc.) and combustible addns. (coal, peat, etc.). The former should be about 3%, the latter 2%. These addns. lead to the formation of a thin crust on the keramsite globules, impermeable to water. Changes of the burning schedule make it possible to obtain crusts of different characteristics and outer appearance. E. E. Stefanowsky

Clay minerals and their hydration in raw clays and calcined bodies. Gustav Keppeler and Gerhard Aurich. *Sprechsaal* 72, 71–5, 83–6, 93–5, 109–13(1939).—Zettlitz kaolin, halloysites, bentonite, allophane and mica were submitted to the following examns.: chem. analysis, isothermal (21°) dehydration over 10 and 96% H_2SO_4 solns. and P_2O_5, isobaric dehydration over 96% H_2SO_4 soln. at 21–792°, detn. of the Al_2O_3 and Fe_2O_3 contents of the dehydrated products sol. in HCl, differential heating curves, hydration and "H_2O expansion" of calcined kaolin and of calcined kaolin + Na_2O and kaolin + CaO mixts., and the dehydration of the artificially hydrated materials. Extensive data are recorded. The results confirm the previously detd. constitution of kaolin, and halloysite and allophane were essentially hydrargillite, and Kärlich blue clay was chiefly montmorillonite. The H_2O adsorption and swelling of calcined kaolin + Na_2O mixts. are due to the hydration of Na_2O-Al_2O_3-SiO_2 compds. of a permutite nature. The corresponding kaolin + CaO compds. are not sensitive to H_2O. These observations explain the relative resistances of Na_2O- and CaO-whiteware bodies to moisture expansion. B. C. P. A.

Bentonite clays in U. S. S. R. N. K. Sazonova. *Trudy LKKhTI, Lab. Keram.* 1939, No. 7, 217–44; *Khim. Referat. Zhur.* 2, No. 5, 88–9(1939).—The bentonites showed the presence of crystals of montmorillonite and admixts. of feldspar and biotite. They swell 3–4 times as much as do the best plastic clays. Their plasticity was studied by the amt. of adsorbed moisture from air satd. with water vapor. During 5 days most samples adsorbed ⅔ of the amt. of moisture which corresponds to a complete adsorption. The refractoriness did not exceed 1300°. Addn. of 5% bentonite lowered the refractoriness of the grog of the Chasov-Yar clay by 10–30°. The Oglanlin bentonites have the best plasticity, adhesion, binding power and swelling properties. Addn. of 5% bentonite to slightly plastic substances increased their plasticity and binding properties. Adding bentonite as a binding material had no appreciable effect on refractoriness. W. R. Henn

Clays and fuller's earths. IV. Isobaric dehydration and moistening of clays. F. Schwarz. *Sprechsaal* 72, 147–8(1939); cf. *C. A.* 33, 6010⁶.—After drying at a temp. θ, clays and fuller's earth reabsorb H_2O at room temp., but reabsorption is most complete and rapid when θ is 160–300°, and very small and slow when θ is greater than 700°. B. C. P. A.

The determination of the pH value of clay by means of the glass electrode. Frank W. Selfridge. *Rubber Age* (N. Y.) 46, 287–8(1940).—It is difficult to obtain precise results by the usual pH methods and a modified procedure was used. Stir 5 g. of clay in 100 cc. of boiled distd. H_2O in a 150-cc. beaker for 1 min. with a glass rod, allow to stand for 20 min. (stirring frequently), centrifuge 50 cc. until clear, decant the clear supernatant liquid, add 5 drops of aq. KCl (36 g. in 100 cc. of boiled distd. H_2O) and det. the pH value. By this procedure, the pH values of dry-ground clays from So. Carolina and Georgia varied from 4.40 to 5.70. Specially prepd. and treated clays showed in some cases pH values of 8.0 or higher. If a centrifuge is unavailable or if the pH value is merely for detg. the uniformity of clay, a procedure for detg. the adsorptive power of clay for K ions is useful. Stir 5 g. of clay, 1 cc. of aq. KCl (as above) and 100 cc. of boiled distd. H_2O with a glass rod for 1 min., transfer 40 cc. to a 50-cc. beaker, allow to settle for 20 min. and det. the pH value of the supernatant liquid. C. C. Davis

Experiments for the production of bricks with addition of schist ash. A. I. Aladinskiĭ. *Stroitel. Materialy* 1938, No. 12, 1–13; *Khim. Referat. Zhur.* 2, No. 5, 94(1939).—Increase in schist ash increased the d. when the moisture content was not over 23–24%. The addn. of ash to clays with a higher moisture content increased the d. only slightly. A max. effect was obtained from the addn. of 1.3% of schist ash to the dry ground clay. In its thickening effect 1 kg. of schist ash was equiv. to 15.1 kg. of clay

dried to a moisture content of 1.4%. The addn. of schist ash to the mixt. lowered the compressive strength of the raw bricks. Burned bricks contg. schist ash have lower compressive strength and high water absorption. W. R. Henn

Effect of batch composition, of the order of charging in the kiln and of the firing schedule in Mendheim gas-chamber kilns on the quality of silica brick. I. S. Smelyanskiĭ and V. D. Tsigler. *Ogneupory* **7**, 382–7(1939).—The quality of coke-oven brick is improved by adding cryst. quartzites to the batch and by firing in a reducing or neutral atm. E. E. Stefanowsky

Floor tile from brick clays of high iron content. P. K. Vaulin and A. A. Novopashin. *Keramika* **1939**, No. 5, 50–4.—Batches prepd. from mixts. of clays high in Fe required longer firing than normal. Semiplant results indicate the necessity of addnl. research, in order to improve the process. E. E. Stefanowsky

A furnace for determination of spalling resistance. V. A. Lebedev. *Ogneupory* **7**, 495–500(1939).—The furnace has an iron frame and a nichrome resistance. E. E. S.

Refractory materials for the bottoms of furnaces. A. I. Kramarenko and L. A. Tseĭtlin. *Stal* **1938**, No. 11, 26–35; *Khim. Referat. Zhur.* **2**, No. 5, 89(1939); cf. *C. A.* **34**, 1144[2].—Chromite bricks with phosphorite and bottoms of chromite concrete were found to give max. resistance to thermal and abrasion agents at temps. above 1300°. At 1300–1400° these substances react very little with Fe oxide. Chromite concrete is a good refractory above 1750°. It was prepd. from clay cement, Saranov chromite, metallurgical magnesite and sol. glass by mixing the dry components without cement, adding cement with 7–8% of water (on the dry wt. of the mixt.), mixing thoroughly and forming into cubes and cylinders under a pressure of 400 kg./sq. cm. The samples were burned at 1450° and kept at the max. temp. for 1 hr. Tests of furnace bottoms of the chromite-magnesite concretes under production conditions verified the data obtained from the lab. expts. W. R. Henn

A monolithic floor of a tunnel kiln car made from refractory concrete. S. N. Vasil'ev. *Ogneupory* **7**, 469–72 (1939).—Best results were obtained with a batch contg. 30% of Al_2O_3 cement. E. E. Stefanowsky

The preparation of refractory material with a high alumina content. Fernando Babini. *Corriere dei Ceramisti* **18**, 391–3(1937); *Chem. Zentr.* **1938**, I, 4366.—Mixts. of clay and Al_2O_3 having the compn. $2SiO_2.3Al_2O_3$ were divided after the addn. of water and portions molded by hand while other portions were treated by the Weber filter method. The masses were all fired at 1350° and tested. The material prepd. by the Weber method was less porous, possessed a higher resistance to breaking, and showed fewer flaws after firing. M. G. Moore

Refractories used in the steel foundry. A. V. Leun. *Trans. Am. Foundrymen's Assoc.* **47**, 534–46(1940).—See *C. A.* **33**, 7062[1]. J. E. D.

Investigation of the expansion and compression curves of Dinas for use in the construction of the diagrams of the heating and cooling of coke ovens. I. S. Smelyanskiĭ and N. L. Pevsner. *Coke and Chem.* (U. S. S. R.) **7**, No. 4–5, 80–90(1937); *Chem. Zentr.* **1938**, I, 4222.—Curves for various qualities of Dinas brick (of U. S. S. R.) were detd and from them the conditions of heating and cooling of coke ovens derived. M. G. Moore

Thermal splintering [chipping] of heat-resistant magnesite stones. Seizi Kondo and Hirosi Yosida. *J. Japan. Ceram. Assoc.* **46**, 4–8(1938); *Chem. Zentr.* **1938**, I, No. 14, 2936.—Water chilling is not a satisfactory test because steam which is generated hydrates the MgO and affects tensile strength. Air chilling gives satisfactory relations between resistance to splintering and tensile strength but errors in measurements become large. Compressive strength is often increased by air chilling. The decrease in modulus of fracture in air chilling shows satisfactory agreement with the modulus of elasticity at high temps. Karl Kammermeyer

Production of refractories from South African magnesite. H. Jacobs. *Minerals Research Lab. S. Africa Bull.* No. 1, 44 pp.(1936); *Ceram. Abstracts* **19**, 69.—J. investigated the manuf. of magnesite brick from pure South African cryptocryst. magnesite. The sintering temp. of the ore was detd., and the effect of adding talc-carbonate rock was studied. Dead-burning was effected in a high-frequency elec. furnace. A complete investigation of the refractoriness under load, spalling and slag resistance, crushing strength, etc., was made. C. L. B.

Determination of water absorption by refractories. M. A. Melamed. *Ogneupory* **7**, 502–8(1939).—Boiling the sample for 30 min. is sufficient. It is not necessary to pour water slowly on the sample before boiling or to let the sample stand for 24 hrs. after boiling. E. E. S.

Stoneware glazes free from lead and boron. Heinrich Roch, Jr. *Sprechsaal* **73**, 54–5(1940).—Several oxides may be used in place of PbO and B_2O_3. BaO and MgO should be avoided. ZnO and CaO together with alkali metal oxides are satisfactory. A recommended glaze is 0.38–0.45 KNaO (Na:K between 2:1 and 1:2), 0.62–0.55 CaO or ZnO, 0.32–0.48 Al_2O_3, and SiO_2 7–10 × Al_2O_3. The glost temp. is cone 2a – 3a. J. M. Noy

The resistance of enamels to acids (a new method for its determination). Gerhard Schmidt. *Chem. Fabrik* **1940**, 49–54; cf. *C. A.* **30**, 1963[9], 6154[1].—Pieces of the enamel are exposed to the acid for different lengths of time and the losses plotted against times. A math. law is developed from the curve and by extrapolation the results of long-time exposures can be predicted. A method of developing the law from short exposures is given. 9 references. J. H. Moore

Testing the "scratch hardness" of different enamels. A. Königer. *Glashütte* **69**, 465–8, 484–6, 499–501, 515–18, 531–3(1939).—See *C. A.* **33**, 1899[1]. In the 15th line of the abstract for "A fluorspar content of 90% or over," read "A fluorspar content of 9% or over." M. V. C.

Enamels with low boric acid content. R. Aldinger. *Glashütte* **69**, 797–9(1939).—The B_2O_3 content of most enamels could be reduced by half without materially affecting their properties. In many cases borax can be eliminated entirely, though the resulting enamels possess different properties and require special prepn. Enamels with low or no borax content can be obtained by the substitution of other fluxes partly or entirely by partial or complete replacement of the refractory materials feldspar and quartz, by other more easily fusible natural or artificial silicates or silicate mixes or by a combination of both. The following ground enamel with low borax content can be used as a starting point in tests: quartz 15 parts, feldspar 32, $BaCO_3$ 5, ZnO 4, fluorspar 16, borax 10, Na_2CO_3 16, $NaNO_3$ 2, CoO 0.3 and NiO 0.3. Mill batch: frit 100, fluorspar 10–15, clay 10, borax 1 and Na_2CO_3 1. The batch compn. of other ground and coat enamels with low borax content is given. M. V. C.

Preventing loss of raw materials and enamel. Richard Aldinger. *Glashütte* **69**, 617–20(1939). M. V. C.

Utilization of the gold-containing waste materials in porcelain faience plants. B. A. Khizh. *Stroitel. Materialy* **1938**, No. 12, 34–5; *Khim. Referat. Zhur.* **2**, No. 5, 88 (1939).—The materials which have been in contact with the Au paint are first burned. The ashes are then transferred to the refinery for extn. Instructions for the collection, storing and regeneration of the gold-contg. materials are given. W. R. Henn

An analysis of the body material of ancient faience found at Antioch-on-the-Orontes. Earle R. Caley. *Tech. Studies Field Fine Arts* **8**, 151–4(1940).—The body was devoid of glaze, was white, very friable and composed of fine grains of cemented quartz. The compn. was: SiO_2 98.64, CuO 0.27, R_2O_3 0.29, CaO 0.11, K_2O 0.12, Na_2O 0.08 and loss on ignition 0.55. The presence of Cu seems to support the theory that the glaze was sometimes used as a binder for quartz particles that formed the body material of ancient faiences. A. W. King

Glass. Algemeene Kunstvezel Maatschappij N. V. Brit. 509,007, July 10, 1939. Molten glass free from stones, bubbles and seeds is produced by heating or melting glass stock in the form of rounded bodies, e. g., ovoids, in a highly internally strained condition. A heat-supply body of molten glass may be provided and the glass stock fed thereto, the heat of the supply body being permitted to melt and cause the stock to slump and form part of the body. The stock may be fed at 1 end of the body and molten glass withdrawn at the other end.

Furnaces for heating glass, etc. Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny et Cirey. Brit. 509,008, July 10, 1939. Liquid baths, e. g., molten glass or salts and other electrically conducting liquids, are heated in furnaces in which at least a part of the heating is effected by passage through the liquid of elec. current from electrodes immersed therein, at least 1 electrode being hollow and formed of a material permeable by gases, e. g., graphite, the hollow of the electrode being closed to the liquid and open to atm. or connected to evacuating means or to means for supplying gas. Undue formation of bubbles at the surface of the electrode is thus avoided.

Furnace and container for melting glass. Paul G. Willetts (to Hartford-Empire Co.). U. S. 2,186,223, Jan. 9. A container for molten glass comprises a bottom including an under support, and an inner portion formed of refractory blocks resistant to the attack of molten glass, granular material disposed between the under support and blocks and of such character as to remain granular during the heating up of the blocks to the highest temp. which they attain during normal use, and material disposed between the blocks of such character that it will seal the joints therebetween and prevent penetration of molten glass through the joints between the blocks to the granular material thereunder. Cf. *C. A.* **34**, 1829[9].

Apparatus for feeding mold charges of molten glass. Thomas F. Pearson (to Crown Cork & Seal Co.). U. S. 2,185,565, Jan. 2. Various structural, mech. and operative details.

Controlling arrangements for the pneumatic operation of automatic machines for feeding and shaping glass. The Sheppee Motor and Engineering Co. Ltd., Samuel G. Jowitt and Frank B. Jackson. Brit. 509,022, July 10, 1939.

Apparatus for making glass bottles, jars, etc. Thomas F. Pearson (to Crown Cork & Seal Co.). U. S. 2,186,174, Jan. 9. Various structural, mech. and operative details.

Apparatus for the manufacture of blown glass articles. Jérôme & Bonnefoy & Cie. S. à r. l. Brit. 508,784, July 4. 1939.

Apparatus for drawing glass tubes. S. I. Korolev. Russ. 55, 962, Oct. 31, 1939. Construction details.

Apparatus for drawing window glass. Don R. Limbers (to Pittsburgh Plate Glass Co.). U. S. 2,184,873, Dec. 26. Various structural, mech. and operative details.

Tongs for use in tempering glass sheet. Lloyd V. Black (to Pilkington Bros., Ltd.). Can. 387,278, Mar. 5, 1940. Structural details.

Regulating the temperature of metal cylinders such as those used in the manufacture of glass sheets. André Do Huu Chan (to Soc. anon. des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny & Cirey). U. S. 2,184,908, Dec. 26. A device for regulating the temp. of a cylinder of the kind used in connection with the manuf. of glass comprises, in combination, a frame, a multiplicity of fine elastic metallic elements mounted in the frame so as to be elastically applied against the surface of the cylinder, whereby an interchange of heat with the cylinder is performed through the elements, the frame being rotatable and the elements forming a cylindrical brush about the axis of rotation of the frame.

Safety glass. James H. Sherts (to Pittsburgh Plate Glass Co.). U. S. 2,184,876, Dec. 26. A plate of safety glass comprises a single glass sheet, a layer of a polymerized incomplete poly-vinyl acetal resin formed by the reaction of poly-vinyl alc. with butyraldehyde mixed with a glycol dihexoate as a plasticizer adhered to one face of the glass sheet, and a layer of polymerized incomplete vinyl acetal resin substantially free from plasticizer and formed by the reaction of poly-vinyl alcohol with CH_2O adhered to the outer face of the first resin layer.

Sealing electric conductors into quartz and like highly refractory vitreous material. The General Electric Co. Ltd., Norman L. Harris and Walter A. Lewis. Brit. 509,077, July 11, 1939.

Ceramic building bricks, etc. Kamillo Konopicky. U. S. 2,184,601, Dec. 26. A ceramic building brick or the like resistant to spalling comprises a base mass of ceramic material which forms its main body, and a surfacing material comprising bodies of ceramic material such as coarse grains spaced at least at the portions of the bodies adjacent the outer surface of the brick from the adjacent ceramic material by interfaces of dividing material such as Al compds. of less tensional strength than the base mass and nonreactive with the adjacent surfaces at temps. to which it is subjected during the formation of the brick.

High-temperature refractory. John D. Morgan (to Power Patents Co.). Can. 387,286, Mar. 5, 1940. A refractory for continuous use up to 3000°F. is prepd. by mixing equal parts of milled and grained zircon with the following based on the wt. of the zircon, MnO 4.6, CuO 1.5, and H_3PO_4 11.6%, thoroughly mixing and digesting, molding to shape, and firing at above 500°F.

Porous refractory. John D. Morgan (to Power Patents Co.). Can. 387,287, Mar. 5, 1940. Milled grain zircon, grain zircon, Al, rosin, gelatin, $Ca(OH)_2$ and water are formed into a porous refractory by reaction at high temp., mixed with 25–75% by wt. of a native refractory and a bonding agent, and the mixt. is fired at a high temp.

Porous refractory. John D. Morgan (to Power Patents Co.). Can. 387,288, Mar. 5, 1940. Milled grain zircon 100, $Al(OH)_3$ 2, H_3PO_4 about 12 parts and enough water are intimately mixed, a granulated solid org. material is intimately dispersed in the plastic mass, the mixt. is dried, and the org. material burned out by firing at a high temp.

Bonded refractory. John D. Morgan (to Power Patents Co.). Can. 387,285, Mar. 5, 1940. A refractory aggregate is mixed with a halide of Mg, Sn, Th, Ca, Al, Zr or Ti, sufficient H_3PO_4 is added to form the metal phosphate, and the product is fired. The amt. of metal halide is 5–15% by wt. of the combined mass on a dry basis.

Mold for casting refractory oxides such as fused alumina. John C. McMullen (to Carborundum Co.). U. S. 2,185,772, Jan. 2. A facing for contact with the molten material is formed of an unfired mixt. of 75–95% of inert refractory granules of about 14–50 mesh and 5–25% of finely divided carbon, with use of a temporary binder such as pitch.

Checkerwork for regenerators such as those used with blast furnaces. Albert Mohr, Jr., Fredrik Wille and John P. Grilli. U. S. 2,185,559, Jan. 2. Various structural details.

Insulating beads for supporting electric conductors. The General Electric Co. Ltd., James R. Lait and Marcello Pirani. Brit. 508,812, July 6, 1939. The beads are made by forming a ceramic body having a thermal expansion approx. that of the wires and provided with holes into which the wires fit, filling the holes, not necessarily completely with molten glass also having a thermal expansion approx. that of the wires, and forcing the ends of the wires into the holes. For Mo wires, a suitable ceramic compn. has the compn. Al_2O_3 64, SiO_2 25, BeO 7, MgO 2 and ThO_2 2%, and a suitable glass, the compn. SiO_2 54.7, Al_2O_3 + Fe_2O_3 20.9, CaO 13.7, B_2O_3 7.7 and BaO 3.0%. Steatite

may be used as the ceramic with Ni-Fe wires of similar expansion.

Abrasive sheet material. Howard G. Bartling (to Minnesota Mining & Mfg. Co.). U. S. 2,186,001, Jan. 9. A flexible backing such as paper or cloth carries an adhesive bonding material in which abrasive grit grains are embedded and which is sepd. from the backing by a layer of hygroscopic material such as gelatin which serves to give pliability.

Coated abrasive sheet material. Nicholas H. Oglesby (to Behr-Manning Corp.). U. S. 2,184,896, Dec. 26. A cellulosic backing such as one of paper or cloth has a layer of grit bonded to it by a layer of synthetic substantially unplasticized resin cured to an inflexible state, at least one third of the vol. of the grits of the grit layer being above the av. level of the resinous adhesive, the bond between the grains extending under and forming a stratum between the bottoms of the grains and the backing and the backing having a substantial portion of its thickness unpenetrated by and unmodified by the resinous adhesive, the resin bond being cured for such time periods and temps. as to have the characteristics of being water-resistant, hard, rigidly holding the grains in place and having a high tensile strength substantially above 6000 lb. per sq. in. and being tough enough to prevent disintegration of the binder or dislocation of the grains from the binder under impacts encountered in use but being sufficiently brittle to permit mech. flexing in which the bond is cracked to impart flexibility to the abrasive articles without serious injury to the bond.

Tunnel kiln. A. F. Krasikov. Russ. 52,273, Dec. 31, 1937. Construction details.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Structure of hydrated portland cement. B. Tavasci. *Chimica e industria* (Italy) **21**, 656–61(1939).—The structures of several old mixes of portland cement which were completely set were observed. The nonhydrated portion shows clearly 4 constituents: *A*, *B*, *C* and *D*, while the hydrated clinker shows a 5th constituent *E*. These constituents are identified as: *A* cryst. $Ca(OH)_2$, *B* the isotropic gel, *C* $2CaO.SiO_2.Al_2O_3.aq.$, *D* a hydration product of celite in alk. medium, created within the cement, *E* is either added $CaCO_3$ or some aluminate formed by added $CaCO_3$ with other cement constituents. Two pages of photographs of these constituents are shown.
A. W. Contieri

Georgia ocher in portland cement. Guy W. Jordan and David P. Hale, Jr. *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. **1135**, 7 pp.(1939).—Cartersville ochers offer the cement industry a large source of a high-Fe product, low in SiO_2, const. in compn., and requiring little grinding. The Fe oxide lowers fuel consumption, increases ease of proper burning, lessens destructive action on refractories, and improves the quality of the cement by reducing expansion and contraction, increasing strength, increasing resistance to freezing and thawing, and increasing resistance to sea water. Alden H. Emery

Mineral content of aluminous cement. N. Sundius. *Proc. Symposium Chem. Cement, Stockholm*, **1938**, 395–421; *Chem. Zentr.* **1939**, II, 3736.—A report on the chem. compn. and mineral content of 4 types of aluminous cements. M. Y. Condoide

Controlling the quality of clinker. J. H. Jennings. *Cement Lime Manuf.* **12**, 47–53(1939).—Mill tests indicate that there is a fairly uniform predictable relationship between the weight per l. of a definitely graded sample of clinker and the optimum quality (min. proportion of free lime and high strength). The clinker as it comes from the kiln passes a sieve having square openings 7 mm. on a side and are retained on a sieve with square openings 4.5 mm. on a side. The test is performed in a few min. and enables the burner-man to produce a more uniform quality of clinker. A. W. King

Manufacture of mortar materials from dolomite. Albert Grimm. *Tonind.-Ztg.* **63**, 463–4(1939).—Better-binding products are obtained when the dolomite is incompletely burned so as to leave 20–30% of CO_2 in the material. This is difficult in the usual types of limekiln, but can be smoothly carried out in a rotary kiln.
B. C. P. A.

Investigation of the corrodibility of mortar and concrete by the determination of the velocity of diffusion. V. V. Kind and I. D. Zaporozhets. *Tsement* **1938**, No. 12, 33–5; *Khim. Referat. Zhur.* **2**, No. 4, 108(1939).—The method proposed by Pshenitsyn and Il'ina (*C. A.* **32**, 6421[8]) is unsatisfactory because the stability of mortar or concrete depends principally, not on its impermeability, but on its chem. compn. and on the compn. of the aggressive liquid or gas. Also, the permeability differs for different ions, whose diffusion velocity depends on their radii and on the adsorptive power of the mortar or concrete for the given ions. W. R. Henn

An answer to the article of V. V. Kind and I. D. Zaporozhets which criticizes the investigation of the corrodibility of mortar and of concrete by the determination of the velocity of diffusion. P. A. Pshenitsyn and N. P. Il'ina. *Tsement* **1938**, No. 12, 35–8; *Khim. Referat. Zhur.* **2**, No. 4, 108(1939); cf. preceding abstr.—The hydrolysis products of the cement are always lime, Ca silicates and aluminates regardless of the compn. of the cement. Numerous other considerations are presented which are in favor of their proposed method for the detn. of the stability of cements. W. R. Henn

Causes of the bond between steel and concrete. B. Pogány. *Cement Lime Manuf.* **12**, 99–102(1939).—Various theories of the causes of the bond are discussed. It is concluded that it is not due to capillary forces and shrinkage alone, but that an additional effect is produced by the gel and cryst. substances of the mortar filling the pores of the steel. The bond may be increased by using larger bars with a softer surface and looser texture, softening the surface of the steel by annealing, roughening the steel surface with acids, and accelerating the setting and drying out of the mortar by raising the temp.
B. C. P. A.

Effect of storage on the moisture content of lumber. J. S. Matthewson. *Wood Products* **45**, No. 2, 12–14(1940).—For the most satisfactory service, such products as flooring and interior finishing woodwork in heated dwellings in most parts of the U. S. should be installed at about 8% moisture content. Curves are given relating relative humidity and temp. to moisture content of wood. Lumber seasoned to low moisture content values should be stored in heated sheds. Whether an unheated shed is closed or nearly closed makes little difference in its effect on the av. moisture changes of the lumber stored therein.
George Ayers

Reconstruction of the ice skating rink at the University of Illinois. John Doak. *J. Am. Concrete Inst.* **11**, No. 1, *Proc.* **36**, 1–20(1939).—A concrete floor contg. steel and brass contraction-joint strips, in which were imbedded black-steel brine pipes, was so disintegrated after 6 years of service that an entirely new floor was built. The brine pipes had failed because of external corrosion; the inside of pipes was intact; much of the concrete was porous, and corrosion was more pronounced in the presence of porous concrete; a potential of 50 mv. existed between the brass joint strips and the pipe, with the pipe positive; wood blocks left imbedded in the concrete and in contact with the steel pipe hastened pipe corrosion. The new floor is made without joints, of torpedo sand, crushed limestone and high-early-strength portland cement, with care to reduce voids to a minimum. **Discussion.** Roy Peck. *Ibid.* **11**, No. 4, *Proc.* **36**, 20–1, 20–4(1940).—P. attributes the failure of the concrete floor to damaging differential

stresses between the brine circulating pipes and the surrounding concrete caused by sudden and wide temp. changes that cracked the pipe and let $CaCl_2$ brine to leak out; electrolytic corrosion is claimed to have continued destruction at these cracks. It is recommended that bond between the pipe and the enveloping concrete be broken by coating the pipe with some liquid film just prior to placing the concrete. A. W. King

Bituminous protective coatings for buildings. Walter Becker. *Angew. Chem.* **53**, 82–8(1940).—A summary which covers the following subjects: prepn. and properties of base materials; types of coatings; application and processing; and standards and regulations. Data and 23 references are given. Karl Kammermeyer

Building decays and their control in the South. Arthur F. Verrall. *Pests* **8**, No. 3, 15–17(1940).—A review referring to chem. control as well as other measures. Henry H. Richardson

Dangers in the use of arsenic compounds in the preservation of wood and paper used in the construction and management of dwellings. H. C. Dudley. *Bull. office intern. hyg. pub.* **30**, 2612–13(1938).—The wall papers generally in use in the U. S. do not contain dangerous amts. of As. Because of the relatively small quantity of As compds. used in the treatment of wood intended for home construction, the danger of As poisoning of the inhabitants from this source is probably small in the U. S. Ruth Berggren

Toximetric method for oil-soluble wood preservatives. Ernest E. Hubert. *Ind. Eng. Chem., Anal. Ed.* **12**, 139–41(1939); cf. *C. A.* **32**, 5531[3], 7239[4]; **34**, 1179[4].—As a standardized method wood blocks uniformly impregnated were tested for permanence of toxicants, resistance to leaching in water and volatilization. In detg. the toxicity of oil-sol. materials against fungi the following allowances for exptl. error should be made for losses in wt. of treated test blocks: (*a*) a 4% max. loss in wt. in any single treated test block, and (*b*) a 1% av. loss in wt. for all treated test blocks in a test run. As a preliminary measure of the resistance to volatilization of any toxicant, the vapor-pressure data at 100° should be used as a guide. Numbered test blocks of ponderosa pine sapwood conforming to specified size are exposed to each fungus used, with controls. All blocks are conditioned to a stated moisture content, wts. and vols. noted. Test fungus for decay is *Lenzites trabea* and for staining of wood *Homiscium gelatinosum*, cultured in a special agar medium. The inoculated containers are incubated at 26–28° for 21 days before the blocks are placed in them. The preservative used is dild. with an equal vol. of solvent naphtha and the test blocks are impregnated, after which they are weighed. They are then reconditioned and incubated at 26–28° for 63 days, scraped, dried and weighed. Computations are given for estg. wt. losses due to decay. For resistance to volatilization and leaching the same method with certain exceptions is used. Lucien Y. Dyrenforth

Properties of soils related to termite control (Hackenyos) **15.** Detection of radioactive cement in cased wells (Howell, Frosch) **22.** Monolithic floor of tunnel kiln car made from refractory concrete (Vasil'ev) **19.** Use of method of thermal analysis [for cement components] (Kind, *et al.*) **2.**

Garner, F. H., Gabriel, L. G., and Prentice, H. J.: Modern Road Emulsions. 2nd ed. London: Road Emulsion and Cold Bituminous Roads Assoc., Ltd. 245 pp. 10s. Reviewed in *J. Inst. Petroleum* **26**, 112A (1940).

Apparatus for drying cement slurry. Niels S. Borch and Kristian Middelboe (to F. L. Smidth & Co.). Can. 387,004, Feb. 20, 1940. Structural details.

Asbestos cement. Mikael Vogel-Jorgensen (to F. L. Smidth & Co.). U. S. 2,185,959, Jan. 2. Various details of app. and operation.

Apparatus for making shingle stock from asbestos fibers and cement. Arthur G. Leonard, Jr. (to Lehon Co.). U. S. 2,184,619, Dec. 26. Various structural and operative details of app. for forming a web and spray-coating it with material such as a coloring compn.

Lining pipes or the like with cementitious material. Harry Ridley. U. S. 2,185,570, Jan. 2. Various details of app. and operation.

Tube mill suitable for treating fuel used in firing cement kilns. Mikael Vogel-Jorgensen (to F. L. Smidth & Co.). U. S. 2,185,960, Jan. 2. Various structural and operative details of an air-swept mill.

Apparatus for manufacture of porous pipe from concrete, etc. Karl Klemschofski and Paul Vrana. U. S. 2,185,597, Jan. 2. Various structural, mech. and operative details.

Plaster of Paris. A. V. Volzhenskiĭ. Russ. 52,113, Nov. 30, 1937. Gypsum stone is ground in a mixt. with burned lime. The gypsum is dehydrated by the heat generated in the slacking of the lime with H_2O present in the gypsum stone.

Cementitious shingles. Norman P. Harshberger (to Bakelite Building Products Co.). U. S. 2,185,195, Jan. 2. A method of making and curing cementitious shingles comprises applying a surface layer of plastic hydraulic cement upon fibrous base material of sufficient rigidity to support by itself the cement surfacing, which extends over certain edges of the base material; forming a compact grouping consisting of a plurality of units of the cement-surfaced base material, and flexible membranes that will not bond to hydraulic cement and of greater dimensions than the units, forming the group while the cement is still plastic with the sides of the units facing each other and with the flexible membranes projecting beyond the edges of the units and covering the cementitious surfacings of the units substantially to prevent bonding of the hydraulic cement side or edge surfacing of one unit with the side or edges of an adjoining unit in curing, and curing the units as thus arranged. The units are adapted for packaging without regrouping the individual layers.

Composition flooring. Robert M. Freer and Geo. Morris (to Imperial Chemical Industries Ltd.). U. S. 2,184,811, Dec. 26. See Brit. 500,650 (*C. A.* **33**, 5625[5]).

Wood preservative. Karl Wolman and Richard Huber. U. S. 2,185,533, Jan. 2. A wood preservative in solid, stable and readily sol. form is formed of an alkali metal chromate, $NH_4F.HF$ or $KF.HF$, and sufficient K_2CO_3 that an aq. soln. of the mixt. has a pH of about 7. Cf. *C. A.* **33**, 2308[3].

Compositions for preserving wood, etc. Alfred D. Chapman and Ralph M. Lindgren (to A. D. Chapman & Co.). U. S. 2,186,134, Jan. 9. A compn. for use in the preservation of cellulosic materials from decay, stain and mold fungi and insects, comprises a water sol. mixt. of an alkali metal salt of tetrachlorophenol or pentachlorophenol, and an alkali metal borate, the ratio of alkali metal salt of the halogenated phenolic compd. to the alkali metal borate being approx. 1 to 1.5.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND A. GEORGE STERN

Some fundamentals of smoke abatement. J. F. Barkley. *U. S. Bur. Mines, Circ.* 7090, 59 pp.(1939). Alden H. Emery

A comparison of producer fuels. A. A. Mitchell. *Gas J.* 229, 301–2(1940).—Tests were made on the inside-type producers of the Woodall-Duckham continuous vertical retorts at Dunfermline with screened coke (over 3/4 in.), unscreened coke and coke nuts (3/4–3/8 in.), resp. The corresponding ash contents of the ashes were found to be 95%, 85%, and 77.8%. P. J. Wilson, Jr. 2

Survey of fuel consumption at refineries in 1938. G. R. Hopkins. *U. S. Bur. Mines, Rept. Investigations* 3485, 6 pp.(1939); cf. *C. A.* 33, 3123[8]. Alden H. Emery

The development and the present position of the I. G. hydrogenation process [for production of liquid fuel]. W. Boesler. *Chem.-Ztg.* 64, 81–4(1940). E. H. 3

Industrial synthesis of hydrocarbons from hydrogen and carbon monoxide. A. J. V. Underwood. *Ind. Eng. Chem.* 32, 449–54(1940).—The Fischer-Tropsch synthesis (Ger. pat. 484,337, *C. A.* 25, 1119) is a process in which liquid hydrocarbons are produced from a mixt. of 1 part CO and 2 parts H_2. The industrial applications and practices of this synthesis are discussed. Co, Ni and Fe are effective catalysts. A Co catalyst supported on kieselguhr gives highest yields and has the longest life. Max. yields are obtained by pressures of 5 to 15 atms. The gasoline fraction is greatest at near atm. pressure. The raw-material sources do not affect the character of the products obtained. Amos G. Horney 4

A method for the determination of the yield of the distillate up to 180° in crude benzene. M. I. Lyukimson. *Coke and Chem.* (U. S. S. R.) 1938, No. 12, 30–1; *Khim. Referat. Zhur.* 2, No. 5, 98(1939).—The amt. of the distillate up to 180° is usually detd. at the moment the temp. is reached without waiting for the product to pass from the condenser. This gives results 1–2% low. W. R. Henn 5

Carbon-residue test not closely related to performance. W. L. Nelson. *Oil Gas J.* 38, No. 35, 48, 51(1940).—The Conradson carbon-residue test is applied to gas enrichment and fuel oils and oils for use in internal-combustion engines. A survey of available data indicates little relationship between carbon residue and service, especially in internal-combustion engines. W. Andrew Wright 6

Rating aviation fuels in full-scale aircraft engines. H. K. Cummings. *S. A. E. Journal* 43, 497–503T(1938).—The A. S. T. M. procedure for rating fuels satisfactorily predicts full-scale values of highly unsatd. fuels, both leaded and unleaded, up to octane no. 84, but fuels of octane no. 74 are underrated by 6–8 nos. and 100-octane no. fuel by 2–4 nos. B. C. P. A. 7

The ignition quality of Diesel fuel. Teturo Suwa and Takeo Inatome. *Rept. Imp. Fuel Research Inst.* No. 40, 96 pp.; *J. Fuel Soc. Japan* 18, No. 201, *Abstracts* (in English)49–58; *Fuel* 18, 310–15(1939). D. A. Reynolds

Laboratory determination of ignitibility of Diesel fuels. G. Vorberg. *Oel Kohle Erdoel Teer* 15, 497–9(1939).—As a measure of ignitibility the H content is unreliable, but the "Diesel index," based on the aniline point and d., and the derived cetene no. (*C. A.* 31, 3677[5]) show good correlation with motoring tests. B. C. P. A. 8

Ignition lag and propagation of combustion in direct-injection Diesel engine. L. Herele. *Forsch. Gebiete Ingenieurw.* 10, 15–27(1939).—Expts. were carried out on a 3-cylinder, 2-stroke, Krupp Diesel engine developing 75 h. p. at 500 r. p. m. The engine was operated under full-load conditions and the ignition lag and the propagation of combustion were measured by the ionization method, using special point electrodes placed inside the combustion space of one cylinder. Ignition starts almost simultaneously at various isolated regions in the confines of the fuel jet which do not occupy a fixed position for successive explosions. The combustion is not propagated along the jet, but spreads out laterally, conforming to local turbulence variations. The irregularities in the spread of the combustion revealed by the ionization method were confirmed by observations of the radiation emitted through a window in the combustion chamber. B. C. P. A. 9

Motor fuel of high octane number. Synthesis of isooctane from water gas. Giulio Natta and M. Baccaredda. *Riv. ital. petroli* 6, No. 65, 14–19(1938); *World Petroleum* 10, 69(1939); cf. *C. A.* 33, 8955[5].—Isobutylene (obtained by dehydrogenation of *sec*-BuOH produced in the synthesis of MeOH from water gas) mixed with a small amt. of gaseous HCl is heated to 100–250° and passed over solid Al_2O_3 previously activated by heating to 400–450°. The isooctene produced is then hydrogenated to isooctane. B. C. P. A. 10

Selective absorption of hydrogen sulfide. D. V. Bezuglyi and M. M. Rudakov. *J. Applied Chem.* (U. S. S. R.) 12, 697–703(in German, 703)(1939).—The conditions for selective absorption of H_2S of coke-oven gas with carbonates and sulfides of alkali metals was investigated. At low velocity of gas stream (0.03 m./sec.) the absorption coeff. of H_2S depends on the pH of the absorption liquid, and the absorption coeffs. of H_2S and CO_2 decrease simultaneously. With an increase of the velocity of gas stream (to 0.5–1 m./sec.), the effect of pH of the absorption liquid gradually diminishes and the selective absorption of H_2S reaches 90–8% and that of CO_2 7–9%. The phenomenon of absorption is explained by slow absorption of CO_2 which proceeded through a stage of slow reaction of hydration of CO_2. A. A. Podgorny 11

Combustion calculations using the mol. H. L. Norris, Jr. *Combustion* 11, No. 9, 41–4(1940).—Combustion calcns. are simplified by expressing the quantities in pound mols. rather than in pounds. This is discussed with reference to the burning of coal, natural gas and oil. Joseph H. Wells 12

The Mizpah coal field, Custer County, Montana. Frank S. Parker and David A. Andrews. *U. S. Geol. Survey, Bull.* 906-C, 85–133(1939). E. H.

Petrography and coking qualities of coals of the Niederbank-saddle-seam. St. Doktorowicz-Hrebnicki. *Panstw. Inst. Geologiczny, Sprawozdania* 8, 209–75(1937); *Neues Jahrb. Mineral., Geol.*, Ref. II, 1939, 846–7.—A detailed account of these coals is given with numerous diagrams and analyses. The volatile constituents vary from 30 to 34% in the durites in which semifusinite and micrinite predominate; they exceed 40% (occasionally reaching 45–46%) in the spore-durite with increased coking capacity; vitrite and clarite are intermediate. Progressive coalification is indicated by a decrease in the ratio O:H from 2.4 to 2.0; the content of free H increases from 3.6 to 4.0; the content of hygroscopic H_2O falls from 4.6 to 2.6 with proportional increase in coking capacity. C. A. Silberrad 13

Coal and ore in Sudetenland. E. Heugel. *Z. Ver. deut. Ing.* 82, 1503–7(1938); *Neues Jahrb. Mineral., Geol.*, Ref. II, 1939, 912–13.—A summary account of the coals of the Sudetenland, which include estd. amts. of 11.6×10^9 tons of brown coal in 3 basins, and over 1.5×10^9 tons of bituminous coal in 3 fields. Their proximate analyses and calorific values are given. The ash of the Idastollen seams contains 2.4% Cu and a good deal of Ag. The only other valuable minerals are those of Joachimstahl—ores of Sn, Co, Ni, W, U and Ra, of which only the 2 last are of much value, and the graphite of the Böhmerwald. C. A. S.

(Coal) research. Gilbert H. Cady. *Mining and Met.* 21, 32–3(1940).—A listing of coal research in progress in 1939; cf. *C. A.* 33, 2678[8]. Alden H. Emery 14

Recent developments in coal research. H. Lowry. *Proc. 2nd Ann. Coal Conf.*, in *West Va. Univ., Eng. Expt. Sta., Tech. Bull.* No. 13, 67–85(1939).—A review. G. G.

Physical and chemical survey of coals from Canadian collieries—Nova Scotia—Inverness County coalfield. R. A. Strong, E. Swartzman, E. J. Burrough, J. H. H.

Nicolls and R. E. Gilmore. *Can. Dept. Mines and Resources, Bur. Mines Mem. Ser.* No. 74, 70 pp.(1939).—Detailed chem. and phys. tests of 4 coals are presented. Data include size distribution, density, size stability, grindability, proximate analysis, ultimate analysis, calorific value, fusibility of ash, analysis of ash, S forms in coal, classification, washing characteristics, and coking properties. Alden H. Emery

Coal preparation. C. P. Proctor. *Mining and Met.* 21, 28(1940).—A review of progress in 1939. For oil-spraying, heavier oils are being used. Heat-drying of coal after washing is increasing. New types of cleaning equipment are listed. Alden H. Emery

Coal flotation. F. L. Kühlwein. *Kohle u. Erze* 36, 247–52(1939).—The economic importance and the merits and disadvantages of the flotation method of coal cleaning are discussed. B. C. P. A.

Processing and carbonization. A. C. Fieldner. *Mining and Met.* 21, 33–5(1940); cf. *C. A.* 33, 2678[8].—Research and construction in 1939 are reviewed. In the complete gasification of coal and coke, progress has been made in the installation of carbureted water-gas machines designed for the use of heavy oil. Further developments have been made in the reform oil-gas process for use in coal-gas ovens and the retort oil-gas process for use in retort benches of all types. This will give greater flexibility by increasing the gas-mfg. capacity of the units. A. H. E.

Washing coal in a dense medium by the loess process of the Dutch State mines. Ch. Berthelot. *Rev. ind. minérale* No. 449, 65–71(1940).—After a brief account of the liquids—heavy or contg. solid in suspension, used in coal-washing, the Staatsminjen loess system as used in the Dutch State mines in Limburg is described in detail, including in particular details of the cyclone thickener. The loess used consists of 75% sand and 25% clay, and costs nothing save for its extn. and carriage. The suspension is very stable, showing no marked increase in viscosity with increase in density until this is almost 1.6. The loss in use is less than 2 kg./ton, and the requirement of water only 700 l. (cf. Driesens, *C. A.* 33, 8956[9]). C. A. S.

Coal analysis. Carl B. Curtis, Jr. *Chemist-Analyst* 29, 9–11(1940).—Simplified directions for the proximate analysis of coal, including the detn. of S by the Eschka method, are given. W. T. H.

Correlation of analysis of coal with the products of carbonization in externally heated retorts. V. F. Parry. *U. S. Bur. Mines, Rept. Investigations* 3482, 37 pp.(1939).—Results from carbonization tests of 125 coals were correlated with their proximate analyses. The amt. of tar that will form, in an externally heated retort is directly proportional to the square of the O-free volatile matter (percentage of volatile matter − percentage of O combined with coal) contained in the coal charged to the retort and inversely proportional to the abs. temp. of carbonization. For the BM-AGA 13-in. retort, tar yield percentage = $10.4\ V^2/T$, where T is the abs. temp. of carbonization and V is the percentage of O-free volatile matter in the coal as charged. The amt. of water that will form during destructive distn. at low temps. is directly proportional to the O content of the coal substance raised to the 1.3 power. The average of 100 distns. in the Fischer retort shows H_2O formed percentage = $0.35 \times O^{1.3}$. The amt. of gas in B. t. u. per lb. of coal is directly proportional to the volatile heating value and inversely proportional to the square of the volatile matter in the coal. The formation of gas at 500–725° is proportional to the av. abs. temp. of the wall of the retort raised to the 3.5 power and at 725–1100° to the square root of the av. abs. temp. of the wall of the retort. The amt. of coke from carbonization = fixed C + ash + R. Factor R is called residual volatile matter and is the percentage of the original coal that remains in the coke as a product of decompn. from volatile matter in the coal. It is related to O-free volatile matter, abs. temp. of carbonization and shape and size of retort. A. H. E.

An x-ray study of carbonization. The effect of inorganic admixtures. H. E. Blayden, J. Gibson, H. L. Riley and A. Taylor. *Fuel* 19, 24–7(1940); cf. *C. A.* 33, 7521[8].—The addn. of certain inorg. reagents to cellulose brings about only small alterations in the crystallographic properties of the chars prepd. from it at 600 and 1000°. Small changes in the a dimension are recorded in certain cases, but none in the c. The considerable increase in C yield which occurs in every case indicates that the primary action of the admixt. is the formation of nuclei around which aromatic condensation can occur. D. A. Reynolds

Advantages of coal carbonization as exemplified in the Curran-Knowles process. M. D. Curran. *Mining and Met.* 20, 560–2(1939).—The Curran-Knowles oven consists of a horizontal hearth, heated by flues beneath, and inclosed by an arched top. The coal charge is approx. 12 in. thick; it may be 8–10 ft. wide and 40 ft. or more long. Cracking of gases and deposition of C are a min. The coke formed ignites easily and sustains combustion at low temps. Fireclay brick is used in the oven construction except in the floor and sole flues; most is of standard size. Distn. products leave the oven at 1000°F. less than retorts. About 45% of the gas produced is required to heat the ovens and furnish power. Feebly coking coals make strong coke. Breeze can be mixed with the coal without impairing the quality of the coke. Expanding coals can be carbonized as easily as shrinking. Power is derived from automobile motors fueled with gas from the process. Tar produced contains a higher percentage of oils and less pitch than the av. grade of tar. Alden H. Emery

Disco [Wisner] plant of Pittsburgh Coal Carbonization Co. [for low-temperature carbonization of coal]. C. E. Lesher and R. E. Zimmerman. *Coal Age* 44, No. 3, 45–9(1939).—A com. plant with a daily throughput of 325 tons of washed screenings or dust is diagrammatically described. The domestic coke (Disco) obtained, which represents about 72% of the coal treated, is dense (d. 8.5), highly reactive, and contains ash 9–10 and volatiles 15–18%. The tar yield is 16 gallons/ton. 4000–5000 cubic ft. (475 B. t. u./cu. ft.) of gas containing 2.5 gallons of light oil are also obtained. B. C. P. A.

The Nürnberg experimental low-temperature carbonization plants and coals tested therein. Josef Ipfelkofer. *Gas- u. Wasserfach* 83, 26–31(1940).—This plant is designed to produce coke of definite form by coking the coal in small sheet iron boxes of 80 mm. height in 3 cast iron upright chambers, 2.375 m. high, 0.26 m. wide and 1.52 m. long, the chambers being heated by combustion products of producer or coal gas mixed with enough air to give the desired temp. Each chamber carbonized approx. 1000 kg. of coal per 24 hrs. Coals available for carbonization included the Peissenberg "pitch" coal from upper Baden and the Stockheim coal which contained 71.1% vitrain. Difficulty had been found in burning or carbonizing this latter coal owing to its friability, low m. p., caking tendency, high ash, etc. The Stockheim coal gave a slightly higher lab. swelling test than the Peissenberg coal, but had 3 times as high an expansion pressure. It also showed an abnormally high resistance to gas flow by the Foxwell test, with a max. at approx. 400°. While the Peissenberg coal was essentially noncaking, and showed but little change in form on carbonization, the Stockheim coal foamed out of the small carbonization chambers, requiring the admixt. of about 90% of other coal to eliminate this. Successful carbonization was obtained by the use of much higher forms and a usable coke was produced. Other coals and blends were carbonized in the smaller forms without difficulty. Further tests will be reported later. R. W. R.

Kinetics of hydrogen consumption, oxygen removal, and liquefaction in coal hydrogenation; effect of rank. C. H. Fisher, George C. Sprunk, Abner Eisner, Loyal Clarke, M. L. Fein and H. H. Storch. *Fuel* 19, 13–16(1940).—A previous investigation (*C. A.* 33, 9587[9]) was continued to include the effect of rank. Anthraxylons were used to eliminate the difference attributable to petrography. Conclusions: The effect of rank on the H consumption rate, and on the total H consumed in a given time is small, and within the limits of exptl. error. That fraction of the O in anthraxylons that is rapidly eliminated as CO_2 and water in the early stages increases with decreasing rank. The course of the elimination of the remaining O is about the same for all samples tested. D. A. Reynolds

Hydrogenation of coal and petroleum. Roberto L. Valverde. *Bol. soc. quim. Peru* **5**, 159–77(1939).—A review of the Bergius process (Brit. pat. 244,730, *C. A.* **21**, 315) and its recent applications. W. F. Bruce 1

The sulfur content of Donetz coals. S. N. Zyman. *Coke and Chem.* (U. S. S. R.) **9**, No. 9, 15–16(1939); *Chimie & industrie* **42**, 797.—The S is distributed throughout the different seams of the deposit in zones; within each zone the variations in the total S content are relatively small. In most cases the org. S content is fairly const., while the pyritic S throughout the deposit varies from 0.02 to 6.48%. The sulfate S generally does not exceed 0.1%. Pyritic S can be calcd. from total S by means of the formula: $S_{pyr} = -0.38 + 0.737S_{tot}$. A. P.-C. 2

Desulfurization of coals. A. Z. Yurovskiĭ, M. M. Lifshits, A. A. Chemeris and A. L. Rubinshtein. *Coke and Chem.* (U. S. S. R.) **9**, No. 4–5, 17–21(1939); *Chimie & industrie* **42**, 800; cf. *C. A.* **33**, 8956[5].—Desulfurization by oxidation of sulfurous compds. by means of a mixt. of O (air) and steam is not suitable for coking coals because it produces a decrease in its agglutinating power. Semicoke can be easily desulfured in this way. Coke can be freed from sulfide S by this method. It is advantageous to use water instead of steam. A. Papineau-Couture 3

Industrial significance of impurities in coal. Sulfur and deposits in boiler-flue gases. J. Mayer and E. P. B. Wilson. *Combustion Appliance Makers' Assoc.* (*Solid Fuel*), Apr., 1939, 9 pp.(preprint); *Colliery Guardian* **158**, 699(1939).—The failure in service of stoker-fired boilers as a result of chem. deposition of condensates from the flue gases is discussed. It is considered that the immunity of pulverized-fuel-fired boilers from acid deposits, e. g., $NaHSO_4$, is due to the gas stream having a dust content of sufficient alkalizing power to neutralize acid deposits, or sufficient absorptive power to deal effectively with any acid mist present. B. C. P. A. 4

Industrial significance of impurities in coal. Impurities and characteristics of industrial coals. W. I. Jones. *Combustion Appliance Makers' Assoc.* (*Solid Fuel*), Apr., 1939, 16 pp.(preprint).—The nature of the impurities present in coals is discussed in relation to the choice of coals for specific purposes. B. C. P. A. 5

Texas lignite. II. Characteristics and combustion. Carl J. Eckhardt. *Southern Power and Ind.* **58**, No. 3, 38–42(1940).—Lignite as now mined in this area has a moisture content of about 35%; as burned the moisture content of the lignite corresponds to a loss of 5 to 6.5%. The danger of spontaneous combustion in piles of lignite has been overemphasized. The C content of lignite is approx. 40% and the H content of the Texas lignite varies from 2 to 4.5%, S from 0.2 to 1.5%, and ash from 7 to 11%. This ash is high enough for satisfactory combustion on grates. R. W. Ryan 6

New methods for the drying of lignite. Helmut Piascheck. *Z. Ver. deut. Ing., Beiheft Folge* **1939**, No. 6, 181–6.—A summary covering the following methods: steam drying, flue-gas drying, flue-gas turbine driers, pneumatic flue-gas driers, and flue-gas recirculation drying. Equipment diagrams are presented. K. K. 7

Process design of wet grinding installations for crude lignite processing. H. J. Hermisson. *Z. Ver. deut. Ing., Beiheft Folge* **1939**, No. 5, 149–54.—A comprehensive treatise with equipment and flow diagrams, and corresponding screen analyses of processed materials. K. K. 8

Combined water in peat. G. I. Porovskiĭ. *Za Torfyanuyu Ind.* **1939**, No. 1, 28–30; *Chimie & industrie* **42**, 640.—The quantity of combined H_2O in peat can be detd. from the displacement of the vol.-temp. curves on freezing. This is not a const. value, for it depends on the moisture content of the peat; at the start, the quantity of combined H_2O increases with the moisture content, and then it begins to decrease. The combined H_2O freezes at a temp. appreciably lower than 0°. A. P.-C. 9

Manufacture of charcoal in portable kilns. G. H. Donald. *Dept. Sci. Ind. Research* (Brit.), *Forest Products Research Records* No. 29, 20 pp.(1939).—Preliminary results obtained in an investigation of the essential conditions for a successful burn are given. The exptl. kiln consisted of a thin steel cylindrical shell, 6 ft. in diam. and 5.5 ft. high, fitted with inlet air pipes and outlet flues, and closed by a slightly conical lid, also of sheet steel. The methods of loading the kiln, igniting the charge, regulating the burning, and "flashing" the charge are all discussed in detail. The rate of burning was regulated by the outlet flues, pyrometers being used to follow the progress of burning. The majority of tests were made on beech cordwood. The size of wood carbonized ranging from 2 to 20 in. in diam., and from 3 to 4 ft. in length. It is estd. that with a kiln of this capacity, and using thoroughly air-dried cordwood which has been seasoning in the woods for not less than 6 months, yields of 450–550 lb. of well-made charcoal of an average volatile content of 12% should be obtained per burn. Two methods for detg. the volatile matter in charcoal are described. B. C. P. A. 10

Gas-producer operation. F. J. Matthews. *Glass* **17**, 44–6, 49(1940).—Elementary theory and outline of operation. Herbert S. Willson 11

Gas purification in small plants. D. K. Taylor. *Gas Age* **85**, No. 6, 28–9, 32(1940).—A description. Joseph H. Wells 12

Gasification of [fuel] particles in suspension. W. Gumz. *Feuerungstech.* **26**, 361–70(1938); cf. *C. A.* **34**, 871[6].—The principles involved are mathematically investigated and basic formulas are developed for the design of suspension gasifiers. B. C. P. A. 13

Cooling coke-oven gases by means of oil. I. Ya. Kryuger. *Coke and Chem.* (U. S. S. R.) **9**, No. 2, 35–7(1939); *Chimie & industrie* **42**, 642.—Use of solar oil or gas oil, instead of water, for cooling coke-oven gases offers the following advantages: lower NH_3 losses owing to its slight soly. in the oil; more complete extn. of the naphthalene from the gases; less corrosion of the cooling pipes; practically no choking of the piping; possibility of recovering the phenols extd. from the gases by the oil. A. P.-C. 14

Regeneration by desorption with a rich gas, of spent oil used for the removal of naphthalene from coke-oven gases. V. V. Zhdanov and D. E. Zil'bermann. *Coke and Chem.* (U. S. S. R.) **9**, No. 3, 42–4(1939); *Chimie & industrie* **42**, 642.—At const. temp. the yield of regenerated gas oil decreases with increase in the degree of desorption of naphthalene from the oil, but the decrease in yield is greater than the reduction in naphthalene concn. At const. naphthalene concn. the yield of regenerated gas oil increases with rise in desorption temp.; the latter should be at least 90°. The quantity of rich gas required increases especially during the elimination of the last traces of naphthalene from the oil. A. Papineau-Couture 15

Use of producer gas for motor transport. Committee on the Emergency Conversion of Motor Vehicles to Producer Gas. Harold Hartley, Chairman. *Gas J.* **229**, 351, 353 (1940).—Results of over 400 road tests covering approx. 50,000 miles with 9 vehicles, 22 producers of 9 different types, and over 120 distinct fuels, including 40 types of anthracite or fuels derived from anthracite are reviewed. Provided suitable equipment and fuels are used, producer gas can be regarded as a practicable alternative fuel for motor vehicles, and can be recommended for use in an emergency for certain types of road transport. Certain types of anthracite and of low-temp. coke have been found to be suitable fuels immediately available in relatively large quantities in Great Britain. Almost any process for low-temp. carbonization of coal can be made to produce fuels suitable for transport producers. High-temp. coke normally made in gas works and coke ovens is not suitable for existing types of producers. P. J. Wilson, Jr. 16

[Intermittent] vertical chambers with continuous [external] water-gas generation. A. Thau. *Oel Kohle Erdoel Teer* **15**, 419–25(1939).—The advantages of narrow, vertical chambers with inset, externally heated water-gas generator are described, with working results (cf. *C. A.* **31**, 4790[9]). The water-gas fuel may be coke, brown coal, or noncoking coal. Although the coal gas mixes with the water gas in the upper part of the generator there is no loss of tar by cracking. B. C. P. A. 17

Standards for manufactured gas and the Wobbe index. Paul Holthaus: *Gas- u. Wasserfach* **82**, 262–3(1939).—

The permissible variations in the Wobbe index for manufd. gas, given in German standards, are erroneous in that they are not consistent with the permissible variations in gross heating value and the related sp. gr. New standards are suggested in which the permissible variations in (abs.) gross heating value are fixed at not over ±25 kg.-cal. (between tests, ±75 kg.-cal.). An equation is then given which relates the permissible variations in gas d. to the heating value and the Wobbe index. R. W. Ryan

New Western Kansas gas-treating plant uses glycol in dehydration process. J. C. Albright. *Gas* **16**, No. 3, 27–9(1940).—This plant treated 20,000,000 cu. ft. (standard conditions) of natural gas per 24 hrs. at around 750 lb./sq. in. The gas is first scrubbed to remove butane and higher hydrocarbons and is then passed through the diethylene glycol contactor, counter current to a glycol flow of 5 gallons per min., reducing the dew point of the gas to 28°F. The glycol contactor has an inside diam. of 48 in. and an overall height of 27 ft. The diethylene glycol is concd. in a bubble type column, the glycol entering at about the half way point and being heated to 295°F. (top temp. of the still 266°F.). R. W. Ryan

A rapid method for determining the hydrocyanic acid content of coal-distillation and similar gases. Constanz Eymann. *Gas- u. Wasserfach* **83**, 52–5(1940).—The Feld method for detg. HCN in coal gas is inconvenient and time-consuming and leads to low values. The rapid and convenient ICN method yields values which are too low and the vol. of gas taken is so low (about 500 cc.) that even a series of such spot tests will fail to give reliable results if the HCN content of the gas is variable. A simple and rapid iodometric method is described which depends on the formation and measurements of BrCN. 50 to 150 l. of gas is passed through 40 cc. of 4 *N* KOH soln. Half of this soln. is slowly added (below surface) to 30 cc. of 8 *N* H_2SO_4 soln. contg. sufficient Br, extra Br water being added if required. Both HCN and HCNS are converted to CNBr. Excess Br is removed by adding a few cc. of 5% phenol soln. After 1/4 hr. 0.5 g. KI is added with shaking; after 0.5 hr. in the dark the soln. is titrated with 0.1 *N* $Na_2S_2O_3$ with starch as indicator. The soln. must remain colorless longer than 10 min. 1 cc. 0.1 *N* thiosulfate soln. = 0.00135 g. HCN. This method checks very well with the $NiCO_3$ method, and is simpler and more convenient than other control methods. It is especially adapted to continuous tests. R. W. Ryan

Concentrated ammonia liquor. Details of an investigation carried out in Australia. South Australian Gas Co. *Gas World* **112**, 76–7(1940).—A still was constructed of tin plate. With a feed of 24 gal. per hr. at 62.5° it produced a liquor contg. 20% NH_3 without deposition of NH_4 carbonate. P. J. Wilson, Jr.

Recovery of pyridine bases from the waste gases from the ammonia saturator. W. Klempt and R. Röber. *Chem. Fabrik* **1940**, 65–8.—Expts. were made to see if it would be possible to recover profitably the pyridine bases from the gas system of by-product coke plants, and, if so, at what point. The work is described in some detail pyridine balances are shown on flow-sheets for 2 types of plant, and it is concluded that recovery is feasible and that in practical operation a suitable washer with strong H_2SO_4 should be inserted behind the NH_3 saturator. J. H. M.

Solution of various fuels in phenol under hydrogen pressure. I. B. Rappoport and A. D. Khudyakova. *J. Applied Chem.* (U. S. S. R.) **12**, 759–66(in French, 766) (1939).—Equal quantities of coal and phenol were heated in a 2-l. autoclave at 250, 300, 350, 375, 400 and 420° under initial H pressure of 80 atm., at a velocity of heating of 3.3° per min. The amt. of ext. varied with the temp. used; under suitable conditions coal can be completely dissolved. Depolymerization takes place at high temp. in the presence of solvents, but without mol. decompn., since the gas obtained during extn. contained only a small amt. of methane hydrocarbons. A. A. Podgorny

Purification and stabilization of high-boiling phenols from peat tar. E. V. Lipkina. *J. Applied Chem.* (U. S. S. R.) **12**, 1172–7(in French, 1177)(1939).—These phenols can be stabilised and purified with $CuCl_2$ at 18–20°. $FeCl_3$ had about the same effect. $AlCl_3$, $ZnCl_2$, $NiCl_2$, Cu_2Cl_2, HCl and H_2SO_4 gave no positive results. Of all inhibitors now used, furfural gave a stable product. A. A. Podgorny

Results of coal tar research in the last 30 years. O. Kruber. *Angew. Chem.* **53**, 69–74(1940).—A comprehensive summary with 60 references. Karl Kammermeyer

Catalytic hydrogenation of phenolic oil in low-temperature tar. VIII. Effect of some catalysts on the desulfurization of phenolic oil. Singo Andō. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 358(1939); cf. *C. A.* **33**, 8961[1].—A pitch-free low-temp. tar phenolic oil was treated with 4.0–5.6% of H at 90–110 atms. in a rotating autoclave at 462–9° in the presence of 5% Fe_2O_3, Ni_2O_3, $SnCl_2$, and a mixed catalyst (10% $(NH_4)_2MoO_4$, 9% Ni_2O_3, 36% Fe_2O_3 and 45% Al_2O_3). The products made without catalyst and with Fe_2O_3 required 8.0 and 6.5%, resp., of Ni_2O_3 for hydrogenation at 300° to give the higher alcs. of the cyclohexanol series. For the products made with the other catalysts, only 2% of Ni_2O_3 was required for the hydrogenation, indicating a more complete preliminary desulfurization. Arnold M. Collins

Coking acid tar. V. K. Shchitikov and G. N. Krutikov. *Neftyanoe Khoz.* **20**, No. 3, 34–8(1939); *Chimie & industrie* **42**, 647–8.—Coking acid tar yields 14.2–19.7% of distillate, 33.3–34.8% of coke and 27.3–37.3% of gas and losses. The coke contains on the av. 2.65–3.85% of ash and 2.21–3.37% of S. It is not suitable for the manuf. of electrodes but can be used as fuel. The distillate contains 22.8–26.3% of crude motor spirit and 25–29.3% of kerosene fractions. Purification of the crude spirit with H_2SO_4 and clay yields a stable product. The kerosene, on the other hand, does not lend itself to combined or acid refining. A. Papineau-Couture

Methylated semicoking. G. I. Deshalit. *Coke and Chem.* (U. S. S. R.) **9**, No. 4–5, 44(1939); *Chimie & industrie* **42**, 709.—Methylated semicoking consists in carbonizing coal (lignite) in presence of certain addns. (soln. of $Ca(OAc)_2$ or of Na_2CO_3) so as to decrease the proportion of phenols in the tar and increase the methylated hydrocarbon content therein. Expts. showed that the compn. of the coking gases was but little modified. A high yield of light motor spirit is obtained. A. P.-C.

Coking of coal with the addition of portland cement. Influence of the addition on the coking process, especially on the distribution of sulfur and on the properties of the resulting coke. Ivan Trifonov and Mstislav Kurchatov. *Ann. univ. Sofia, II. Faculté phys.-math.*, Livre 2, **35**, 249–83(in German, 284–8)(1938–39); *Brennstoff-Chem.* **20**, 163–8(1939).—Based on results obtained by coking, under various conditions, 5 types of coal, pulverized and mixed with 1, 3, 5 and 10% of portland cement, the addn. of the cement had no influence on (1) hygroscopicity of the coke, (2) yield of coke and volatile products except with large addns. of cement where there is a decrease in coke yield and increase in yield of volatile products, (3) S present in the coke as sulfate (the sulfate of the cement forms sulfide during the coking process), (4) org.-S content of the coke except with large addns. of cement where it is increased and (5) pressure resistance of the coke stored in wet condition. The addn. of cement raised (1) the ash content of the coke, (2) the total S content of the coke (with rapid coking of the pressed and moistened mixt.), (3) the noncombustible-S content of the coke in proportion to the amt. of cement added, (4) S present in the coke as sulfide, especially with the pressed and wet mixt., (5) yield of distillate, (6) free-Fe content of the coke and (7) sp. gr. of the coke. It decreased (1) the total S content (with slow coking), (2) the volatile S (with increasing cement addn.), (3) combustible portion of the S in the coke, (4) coke porosity and (5) pressure resistance of the coke stored in dry condition. The mech. properties of the coke were improved by cement addn. during the coking process. George Ayers

Behavior of the so-called organic coke-sulfur at temperatures above 1000°. Ivan Trifonov and Viktor Ivanov. *Ann. univ. Sofia, II. Faculté phys.-math.*, Livre **2**, **35**, 201–25(in German, 226–31)(1938–39).—A metal-

lurgical coke and a bituminous coke, after extn. with dild. HCl at 70–80° to remove inorg. S compds., were heated at various temps. between 1100° and 1600° in both N and H atms., resp.; only a small portion of the so-called org. S was liberated up to 1500°, the S liberated being greater in the case where H was present. At 1500° the amt. of S liberated was an exponential function of the temp. and, by comparison with the amt. of S liberated by heating natural graphite, the S would probably be completely liberated above 2000° (about 2200° for the graphite). The S is probably in "solid soln." in the carbon as a mixed crystal system, graphite–carbon, where S atoms occupy positions in the graphite crystal lattice. George Ayers

The effect of ash components on the reactivity of coke. R. N. Golovatyi. *J. Applied Chem.* (U. S. S. R.) **12**, 1178–86(in French, 1186)(1939).—The action of chlorides of Fe, Ca, Al, Mg, Mn and K and silicic acid, on the reactivity of coke was investigated at 700°. The reactivity of coke increased with an increase of the relation (Fe + Ca)/(Al + Si). The most effective catalysts were Fe, Ca and K; less effective were Mg and Mn; Al and SiO_2 were neg. catalysts. Their action depends on the nature of coke The mixt. of catalysts was more effective than a sep. component. With an increase of temp. to 1000° the activity of catalysts increased. Fe increased and SiO_2 decreased the reactivity of coke at the temp. of beginning of the reaction between CO_2 and C. A. A. Bodgorny

X-ray examination of the fissuring of coke. V. I. Danilov, M. A. Levachevich and I. Z. Olifirenko. *Coke and Chem.* (U. S. S. R.) **9**, No. 4–5, 50–1(1939); *Chimie & industrie* **42**, 800.—X-ray examn. confirmed that the formation of fissures is caused by inclusions in the coke, the pieces contg. the largest no. of inclusions being the most fissured. A. Papineau-Couture

Improving the physicomechanical properties of coke. A. Bruk and B. Shtromberg. *Stal* **8**, No. 11, 1–5(1938); *Chimie & industrie* **42**, 642.—When the charges for coking are prepd., consideration must be given to the other properties, in addn. to the plastometric properties, of the coal. The degree and nature of fissuring are a better indication of the quality of coke than is the drum test. On the whole, increasing the rate of heating of the coal lowers the mech. qualities of the coke. By addn. to the charge of finely crushed coke or nonagglutinating coal, under suitable conditions, the mech. strength of the resultant coke can be increased. A. Papineau-Couture

Physical and chemical properties of cokes made or used in Washington. H. F. Yancey, R. E. Zane, R. W. Fatzinger and J. A. Key. *U. S. Bur. Mines, Tech. Paper* **597**, 44 pp.(1939).—Cokes made from Washington coals were resistant to shattering; the av. 2-in. shatter index for Wilkeson cokes was 82, while many of the eastern and southern cokes have indexes about 70. Wilkeson beehive coke had a high stability factor; lower stabilities were shown by by-product cokes from Wash. and British Columbia. Utah coke had the lowest stability factor, but highest hardness index. Friabilities were Wilkinson 58.9–68.5, Wash. by-product 73.8–77.0, Utah 79.9 and low-temp. Coalene 86.1. Wash. cokes were more resistant to breaking up into smaller pieces than eastern and southern cokes but were less resistant to abrasion. Wash. cokes have 1 undesirable feature—a high ash content. S is low. The cokes were fairly reactive. Ignition temps. were 460–570°. Alden H. Emery

Lavine, Irvin: Lignite, Occurrence and Properties. Grand Forks, N. Dak.: Dept. of Chem. Engineering, Univ. of North Dakota. 178 pp. $1.00. Reviewed in *News Ed.* (*Am. Chem. Soc.*) **18**, 261(1940).

Motor fuels. Standard Oil Development Co. Brit. 508,913, July 7, 1939. A relatively small proportion, e. g., 0.1–1%, of a fatty oil., e.g., rapeseed or fish oil, that has been thickened by voltolization, preferably to a viscosity of 50–3500 sec. Saybolt at 210°F. is added to motor fuels. The voltolization product may be hydrogenated and it may be blended with an unvoltolized oil, e. g., a lubricating oil. It may be extd. with solvents, e. g., BuOH, PrH, Me_2CO, and only the high mol. wt. portion employed.

Gasoline recovery from materials such as various hydrocarbon mixtures. Raymond C. Lassiat (to Houdry Process Corp.). U. S. 2,186,029, Jan. 9. An arrangement of app. is described, and a process of recovering a max. quantity of com. gasoline from a composite hydrocarbon stream which comprises subjecting the stream to a series of fractionating operations to segregate therefrom a low-vapor-pressure gasoline and a cut composed substantially of hydrocarbons of the 4 carbon group, subjecting the cut under polymerizing conditions to a polymerizing operation to convert at least a part of the unsaturates therein into liquid hydrocarbons utilizing the liquid polymers from the polymerizing operation as reflux in one of the fractionating operations so as to augment the quantity of the low-vapor-pressure gasoline, and adding to the gasoline sufficient gaseous material from the polymerizing operation to raise the vapor pressure thereof.

Liquid gasolinic hydrocarbons from olefinic materials. Arthur L. Lyman (to Standard Oil Co. of Calif.). U. S. 2,186,031, Jan. 9. A process for the production of gasoline-boiling liquid hydrocarbons from a mixt. consisting substantially of hydrocarbons having less than 5 C atoms per mol. and contg. normally gaseous olefin hydrocarbons comprises bringing the mixt. into contact with a dil. acid soln. for the removal of potential catalyst-poisoning impurities and subsequently polymerizing the normally gaseous olefin hydrocarbons producing gasoline-boiling liquid hydrocarbons in contact with an acidic polymerization catalyst effective to polymerized normally gaseous olefin hydrocarbons to gasoline-boiling liquid hydrocarbons.

Diesel fuel. Edwin M. Nygaard and Geo. S. Crandall (to Socony-Vacuum Oil Co.). U. S. 2,185,157, Dec. 26. To accelerate ignition of the fuel in an engine of the Diesel type, there is mixed with it a minor proportion (suitably about 0.5%) of tetranitromethane. Cf. *C. A.* **34**, 1155[9].

Apparatus for spraying liquid fuels into combustion chambers. John W. Smith. U. S. 2,186,216, Jan. 9. Various structural and operative details.

Destructive hydrogenation of solid carbonaceous materials. International Hydrogenation Patents Co. Ltd., Siegfried Kiesskalt and Karl Winnacker. Brit. 508,813, July 6, 1939. Addn. to 463,602 (*C. A.* **31**, 6852[8]). In the process of 463,602 the sludgy residue is provided with an acid which is mixed thoroughly therewith before the sludgy residue is kneaded with the aq. paste of finely comminuted initial material for removal of the ash therefrom.

Preparing and utilizing pulverized fuels. Walter G. Noack. U. S. 2,184,845, Dec. 26. App. is described in which combustion gases of a boiler furnace are used for driving a gas turbine for driving a blower for combustion air and a turbine for operating a coal pulverizer.

Apparatus for pulverizing briquets such as those made

from pulverized coal. Ralph M. Hardgrove (to Babcock & Wilcox Co.). U. S. 2,185,459. Jan. 2. Various details of an app. for supplying pulverized fuel to a furnace.

Treating lump coal to inhibit degradation from weathering and handling. Richard C. Marmaduke (to Sherman Marmaduke). U. S. 2,184,621, Dec. 26. A process of treating solid, individual lumps of coal to resist degradation incidental to weathering and handling the coal involves coating the coal with a crystallizable soln. consisting of paraffin wax and a liquid hydrocarbon having a burning time of more than 16 hrs. and a Saybolt viscosity of less than 150 sec. at 38°, and effecting crystn. of the applied soln. for forming a dry substantially nonvolatile film covering on the lumps.

Treatment of crude anthracene. I. Ya. Postovskiĭ, B. I. Ardashev and V. I. Khmelevskiĭ. Russ. 52,391, Dec. 31, 1937. Crude anthracene is treated with maleic anhydride and alkali to form a sol. compd. The soln. is sepd., acidified, and heated to 270° to sep. anthracene. From the anthracene-free residue carbazole is obtained by treatment with H_2SO_4 in the presence of C_6H_6.

Recovery of tar from peat-tar waters. V. A. Radtsig. Russ. 52,167, Nov. 30, 1937. The sp. gr. of the water is increased by adding inorg. salts and, after settling, the tar is sepd. in the usual manner.

Gasifying solid fuels. B. K. Klimov. Russ. 55,852, Oct. 31, 1939. In the gasification of solid fuels in a producer-type app. accompanied by cracking of the tar vapors, the tar vapors are kept in the gaseous state by subdividing the producer into a number of zones each heated separately through gases preheated in a separate furnace.

Gasification of solid fuel. M. K. Grodzovskiĭ and Z. F. Chukhanov. Russ. 55,961, Oct. 31, 1939. The gasification is effected in only one oxidizing zone, with the blowing velocity such that contact of the gases formed in the zone as the result of the primary interchange of the fuel with the oxygen of the stream (such as CO and H_2) is of shorter duration than required for a practically noticeable interchange of these gases and the O of the stream.

Muffler and carbon-removing filter for engine exhaust gases. Hiram H. Boyce (50% to Glenn W. Pierce). U. S. 2,185,584, Jan. 2. Various details are described, of a device in which a filtering mixt. is used contg. about 7 parts of a mixt. of equal parts of $CaCO_3$ or $Ca(OH)_2$ and one part of $CaSO_4.H_2O$ together with one part of charcoal.

Water-vapor control in gas-producer operation. Albert L. Galusha. U. S. 2,185,077, Dec. 26. Various structural and operative details are described of a gas producer having a water jacket, means for heating and moistening in the water jacket all air supplied to the gas-producer fire, means for supplying water to the water jacket and means for removing ash from a wall of the water jacket to maintain substantially uniform conditions for the transfer of heat from the fire to the water jacket, and thermostatic means controlled by the temp. of the supplied air and for controlling the supply of water.

Combustible gas from liquid fuels such as fuel oil, gasoline or an alcohol. Henry Gault. U. S. 2,185,549, Jan. 2. App. is described, and a continuous method of generating a combustible gas mixt., which comprises, directly pouring in a continuous manner onto the top portion of a red hot mass, having interstices therein consisting solely of a refractory material, a liquid fuel in the compact state in the presence of a combustion-sustaining gas, so as to produce complete combustion of the fuel as it flows through the whole of the mass and to maintain the latter at red heat, and simultaneously introducing into the mass thus heated, at an intermediate point thereof, a further amt. of fuel together with an amt. of air insufficient for sustaining the combustion thereof, so that the last-mentioned amt. of fuel is subjected to the heating action of the mass and generates, at the outlet thereof, a gaseous combustible mixt.

Breaking water-gas-tar emulsions. Harry B. Pearson, Jr. (to Semet-Solvay Engineering Corp.). U. S. 2,185,710, Jan. 2. An arrangement of app. is described, and a process which involves continuously adding an alk. demulsifying agent such as NaOH soln. to a stream of water-gas-tar emulsion, in an amt. to produce a mixt. having an alky. corresponding to a pH of at least about 8, continuously heating the mixt. to about 24–175° under a gage pressure of about 50–120 lb., permitting the mixt. to sep. into water and tar layers in a settling zone to which the mixt. is passed under such pressure, separately withdrawing the water and tar and then releasing the pressure thereon.

Evaporator for phenol-containing waters of gas plants. M. A. Nechaev. Russ. 52,223, Nov. 30, 1937. Construction details.

Recovering sulfur from used gas-purifying masses. Alexander Wacker Gesellschaft für elektrochemische Industrie G. m. b. H. Brit. 508,966, July 7, 1939. The masses are extd. with perchloroethylene in the liquid and (or) vapor phases. The mass may be treated first with the vapor to remove S and any tar, the earlier portions being run off separately, and the treatment then continued with hot liquid solvent, or liquid and vapor may be used simultaneously.

Dry desulfurization of gas. V. G. Bocharov. Russ. 55,930, Oct. 31, 1939. To regulate the temp. and moisture content of the gas, it is passed through coal or coke before passage through Fe oxide.

Apparatus for regulating the flow of tar, oils, etc. Herbert Ziebolz (to Askania-Werke A.-G.). U. S. 2,185,970, Jan. 2. Various structural, mech. and operative details.

Separating solid-oil mixtures. I. G. Farbenindustrie A.-G. Brit. 508,849, July 3, 1939. Solid substances are sepd. by filtration from the oily constituents of mixts. obtained, e. g., in the distn. or solvent extn. or the pressure hydrogenation of solid carbonaceous substances such as coals, peat, shales, wood, etc., or as residues in the pressure hydrogenation or cracking of liquid carbonaceous materials such as tars or crude oils, by using as filter aids liquid or liquefied hydrocarbons, rich in H and contg. at least 4 C atoms in the mol., that boil below 325° and consist of 1 or more fractions in which the H:C ratio is at least 15:100 by wt. insofar as they boil within 200–325° and contain constituents boiling within 300–325°, at least 17:100 insofar as they boil within 200–300° and at least 17.5:100 insofar as they boil below 200° and taking care that the mixts. have attained a temp. above 120° within such a short time that no lasting pptn. of asphalts occurs and that the temp. is maintained or not decreased below a temp. at which asphalt is pptd. during the filtration.

Separating phenols from tar oils and like products. Herbert Wittek. Brit. 509,083, July 11, 1939. See Fr. 838,900 (*C. A.* **33**, 7082[6]).

Coke ovens. Carl Otto and C. Otto & Co. G. m. b. H. Brit. 508,920, July 7, 1939. An under-fired oven in which the heating gas is supplied to the heating flues by horizontal distributing pipes running in the longitudinal direction of the oven chamber and by transverse pipes that connect the distributing pipes with vertical pipes leading to the flues has the transverse and distributing pipes located in the cellar-like space of the oven structure wherein the transverse pipes accommodate, at their ends adjacent the vertical pipes, nozzles each of which is detachably secured by screw means to a cross member that connects the assocd. transverse and vertical pipes and is removable through an aperture in the cross member closable by a removable cap, the arrangement being such that the nozzle projects into the transverse pipe and neither it nor its securing means forms an obstruction in the bore of a vertical pipe or a downward extension thereof.

Coking-retort oven. Fred Denig (to Koppers Co.). U. S. 2,186,237, Jan. 9. Various structural and operative details.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER AND STEWART S. KURTZ, JR.

Bureau of Mines—A. P. I. pressure core barrel. D. B. Taliaferro and R. E. Heithecker. *U. S. Bur. Mines, Rept. Investigations* 3481, 20 pp.(1939).—Progress is described in the design and development of a device to cut and seal specimens of rock with their naturally contained fluids. Alden H. Emery

Practices and methods of preventing and treating crude-oil emulsions. G. B. Shea. *U. S. Bur. Mines, Bull.* 417, 106 pp.(1939).—S. describes causes of emulsification, methods now used to prevent formation of emulsions in oil-producing operations, modern practices and methods of economically dehydrating crude-oil emulsions, and recent advances in emulsion-treating technique. Alden H. Emery

Properties of a petroleum-reservoir liquid and its residua with applications of the data to production problems. Kenneth Eilerts, R. Vincent Smith and Alton B. Cook. *U. S. Bur. Mines, Rept. Investigations* 3474, 47 pp.(1939).—New app. developed included a steel pycnometer for measuring the sp. vol. of fluids having high vapor pressure, a simplified variable-vol. cell for detg. expansibility of fluids under conditions of phase equil. and a fractional distn. assembly for analyzing gaseous and liquid hydrocarbons. Methods for detg. properties of a reservoir fluid were developed. The equipment and procedures are described. Data from a typical fluid are presented. An important development is an analytical method for comparing compns. and other properties of hydrocarbon liquids obtained at different points in the flow stream. The amt. of gas liberated from liquid soln. and the resultant vol. change in the solvent can be detd. without knowledge of pressure and temp. gradients and the type of liberation in the flow stream between the points at which the samples were taken. Alden H. Emery

Survey of crude oils of the producing fields of Arkansas. O. C. Blade and George C. Branner. *U. S. Bur. Mines, Rept. Investigations* 3486, 40 pp.(1940).—Analyses are given of 45 samples of crude oil from 25 fields in 6 Ark. counties. The most predominant characteristic is high S content, averaging 1.51%, with 35 contg. more than 0.7%. In general, A. P. I. gravity decreases, C residue increases, residuum increases, and gasoline and naphtha decrease with increasing S. The largest no. of samples are of intermediate base; the 2nd largest class is naphthene-intermediate. Alden H. Emery

The (petroleum) oils of Lobato. Mario da Silva Pinto. *Bol. ministerio agr.* (Brazil) 28, No. 1-6, 57-80(1939).—The crude oils of the Lobato district are of the paraffin-base type, with 0–20% gasoline, low in S and unaccompanied by salt water. Numerous analyses are given. O. W. Willcox

Properties of Louisiana crude oils. II. Additional samples. E. L. Garton. *U. S. Bur. Mines, Rept. Investigations* 3476, 85 pp.(1939).—Complete analyses of 72 samples of crude oil from 45 fields in 23 parishes in La. are tabulated and discussed. Cf. *C. A.* 29, 6029[1]. Alden H. Emery

A comparison of the chemical characteristics of crude oils produced in the old and new Illinois fields. O. W. Rees and P. W. Henline. *Trans. Illinois State Acad. Sci.* 32, No. 2, 122–3(1939).—Crude oils from the newer Illinois fields in general show higher gravities, lower viscosities, higher gasoline yields, lower b. ps. and lower av. mol. wts. than those from the older fields. S values for the new oils appear to be somewhat higher. Characterization factors (*C. A.* 27, 5522) are appreciably higher; this indicates that the newer oils are more paraffinic than the older productions. J. H. Reedy

Results of the preliminary investigations of the Ukraine crude oils. V. I. Fomenko. *Trudy Neftyanoĭ Konf. Kiev., 1938, Akad. Nauk U. S. S. R.* (Inst. Geol. Nauk) 1939, 243–53.—The crude oil from well 2-B had d_{20} 0.954, E_{50} 22.37, E_{100} 2.73, Holde-Sakhanov pour point −10°, paraffin 0.75%, acidity 0.43%, resins as detd. by the tax or "excise test," about 40%, asphaltenes 0.7%, and total S (Eschke) 0.05%. The resin complex was broken up into "excise test" resins 36%, silica gel resins 16.94% and asphaltenes 1.01%. The initial b. p. of the crude oil was 235°. The crude oil from well No. 3 had d_{20} 0.8369, S 0.44%, pour point below −105°, paraffin 0.56% (m. 4°), Brenken flash 17°, acidity 0.028 mg. KOH, or 0.002% SO_3, "excise test" resins 8.5% and silica gel resins 3.36%, and initial b. p. 48°. It contains 35.5% b. below 200°. A. A. Bochtlingk

Determining presence of oil by estimation of hydrocarbon content of soil. I. Milton Le Baron. *Oil Gas J.* 38, No. 35, 43, 46, 47(1940).—Various methods of detg. the volatile and nonvolatile hydrocarbon contents of soil samples are discussed and app. for ultimate analysis is described. Much work is needed to confirm this type of field evaluation. W. Andrew Wright

Well logging by radioactivity. G. H. Westby and S. A. Scherbatskoy. *Oil Gas J.* 38, No. 41, 62–4(1940).—A new logging method is described. All rocks have small but definite radioactivity dependent on the type of rock. Shales are usually the most radioactive, while the sandstones and pure limestone exhibit the least activity. The method permits logging of wells either with or without casing being present. Sample log sheets are given. W. Andrew Wright

Detection of radioactive cement in cased wells. Lynn G. Howell and Alex Frosch. *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 1113, 8 pp.(1939).—A device for measuring relative intensity of γ-rays in wells is described. If a radioactive substance is incorporated in cement results of cementing of wells can be detd. accurately. Alden H. Emery

Complex phosphates for deflocculation of drilling mud. C. F. Bonnet. *Oil Gas J.* 38, No. 38, 39, 42(1940).—Examn. of the various com. sodium phosphates indicates that only the "complex" phosphates are effective for deflocculating drilling muds. The effects on viscosity and the cumulative effects of added chemicals are discussed. Na tetraphosphate was found to be especially suitable. W. Andrew Wright

Effect of temperature on plastering properties and viscosity of rotary drilling muds. H. T. Byck. *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 1116, 8 pp. (1939).—The plastering properties of 6 representative Calif. drilling muds were studied at 70–175°F. at several mud wts. In all tests, filtration rates at elevated temps. were higher than at low temps. and in nearly every case this increased filtration rate was notably longer than could be attributed alone to the decreased viscosity of H_2O (the flowing medium) at elevated temps. No existing method will permit even an approx. detn. of filtration rate at high temp. from data at room temp. There was no relationship between mud viscosity and plastering properties; chem. treatment of muds for viscosity reduction shifted the temp. of min. viscosity to appreciably higher values than for untreated muds. Alden H. Emery

Gravity-correction chart for emulsified petroleum. Anon. *Oil Gas J.* 38, No. 38, 34(1940).—A nomographic chart is given for rapid detn. of the wet or dry gravity of an oil contg. water, if either gravity is known. W. Andrew Wright

Supplementary notes on pyroschists in France. V. Charrin. *J. usines gaz* **56**, 463–5(1939).—Addnl. data are given on pyroschists. Besides the bituminous schists of Autun there are considerable deposits in the Basse-Isére range, above the coal deposits; these schists are probably Permian deposits, contain 50–150 l. oil per ton, thickness 10–30 m., so far unexploited. The amt. available is certainly more than in the Autun basin. The schists of Gévaudan are likewise of importance; they extend over 500,000 hectares, in 10–20 m. thickness, partly recoverable by stripping. These schists are of Toarcian age and give an oil yield of 45–60 l. per ton; the Gévaudan oil is low in S. B. J. C. van der Hoeven

Phenolic compounds from petroleum sources. Edward Field, Fred H. Dempster and George E. Tilson. *Ind. Eng. Chem.* **32**, 489–96(1940).—Three grades of phenolic compds. from petroleum sources were investigated, light, medium and heavy. Each grade was fractionated into 3° cuts, and the chem. and phys. properties were detd. Analysis of the cuts showed that the individual phenolic compds. were present in irregular proportions. Individual compds. present in such proportions as to make petroleum acids and excellent source for their recovery include *o*-cresol, 1,4,2- and 1,3,4-xylenols and isopseudocumenol. Petroleum cresylic acids make highly active *germicides*, and the various fractions showed an increase in the phenol coeff. with the boiling range. P. J. Wilson, Jr.

The constitution of mineral lubricating oils (preliminary communication). N. Dănăilă and Jacob Samuel. *Bul. chim. Soc. Române Chim.* **39**, 3–13(1937–8)(in German); *Bull. sect. sci. acad. roumaine* **20**, 69–78(1938)(in German).—The 200–250° cuts (0.1–0.3 mm.), (I) and (II), from two com. lubricating oils were treated after diln. with naphtha with 3 vols. of 70% H_2SO_4, followed by 3 vols. of 98.33% H_2SO_4, by which unsatd. and aromatic hydrocarbons were removed. After washing with 15% NaOH and water and removal of naphtha, the oils were distd. and the 200–250° cuts (0.1–0.3 mm.), (III) and (IV), taken for analysis. III and IV were dehydrogenated over Pt asbestos at 280–300° under 0.1–0.3 mm. pressure and treated in naphtha soln. with 3 vols. of 98.33% H_2SO_4, washed as above and the 200–250° cuts (0.1–0.3 mm.) taken. These cuts, (V) and (VI), represented III and IV with the hexamethylenic naphthenes removed. V and VI were treated below 10° with 3 parts of a mixt. of 62% H_2SO_4 (d. 1.84), 25% HNO_3 (d. 1.52) and 13% H_2O and the temp. was maintained 3 hrs. at 70°; the oils were then treated with 3 vols. of 98.33% H_2SO_4, reduced with Sn and HCl, washed successively with 15% NaOH, 30% $NaHSO_3$ and water, dried over $CaCl_2$, the naphtha was removed and the fractions (VII and VIII) distilling at 200–250° (0.1–0.3 mm.) were taken for analysis. This treatment removed most of the pentamethylenic naphthenes from VII and VIII. Fractions I–VIII, inclusive, analyzed as follows: olefins (*C. A.* **28**, 3569[9]) none; aromatic compds. 24.0, 6.0, 1.0, 0.5, 0.0, 0.5, 0.5, 0.0%; hexahydroaromatic compds. (*C. A.* **21**, 2787) 7.70, 0.0, 10.14, 0.0, 0.0, 0.0, 0.0, 0.0; C 87.07, 86.23, 86.61, 86.08, 86.71, 85.91, 86.04, 85.27; H 12.89, 13.51, 13.28, 13.89, 13.24, 14.05, 13.61, 14.24%; S (in I and II), 0.24, 0.27%; cryoscopic mol. wt. in C_6H_6 397.5, 365.0, 406.0, 426.0, 393.0, 432.0, 416.0, 429.0; no. of rings in mol. (*C. A.* **27**, 406) 4.0654, 3.5050, 4.0051, 3.4810, 3.9923, 3.4778, 3.9704, 3.4474; Vlugter, Waterman and van Westen (*C. A.* **29**, 7057[6]) analysis: no. of rings in mol. 2.9, 2.3, 3.0, 1.5, 3.0, 1.5, 3.4, 2.0; aromatic rings, 12.0, 3.0, 5.0, 3.0, 4.0, 4.0, 1.0, 3.0%; naphthenic rings, 30.0, 19.0, 38.0, 19.0, 40.0, 18.0, 47.0, 23.0%; paraffins, 58.0, 78.0, 57.0, 78.0, 56.0, 78.0, 52.0, 74.0%.

George Ayers

Ultraviolet spectrum of paraffins and petrolatums. Edmond Vellinger and Bernard Thomas. *Compt. rend.* **210**, 296–7(1940); cf. *C. A.* **34**, 1467[4].—The ultraviolet (λλ 2000–4000 A.) spectra of pure paraffins and pure cyclanes show no characteristic differences. But crystd. paraffin extd. from petroleum shows an absorption some 100 times greater than that of a paraffin oil from which all aromatic nuclei have been removed by oleum. Again the solid residue remaining when petrolatum is fractionated in the cathode vacuum is highly absorbent. Conclusion: This is due to the presence, in addn. to true paraffins and cyclanes, of highly substituted aromatic hydrocarbons. Cf. Yannaquis, *C. A.* **33**, 9611[2]. C. A. Silberrad

Hazard of mercury vapor in analytical petroleum laboratories. C. F. McCarroll. *U. S. Bur. Mines, Rept. Investigations* **3475**, 16 pp.(1939).—Use of liquid Hg in analytical labs. is a potential hazard. Precautions and recommendations in handling Hg are outlined.

Alden H. Emery

Naphthenic acids from Gulf Coast petroleum. Composition of higher-boiling acids. Roy W. Harkness and Johannes H. Bruun. *Ind. Eng. Chem.* **32**, 499–502 (1940).—The naphthenic acids in the lubricating oil portion of a Gulf Coast petroleum have a mol. wt. range of about 220–440, corresponding to 14–29 C atoms per mol. The H deficiency below the fatty acid series ($C_nH_{2n}O_2$) is 4–10 atoms per mol. This is not due to simple unsatn. but to naphthenic rings with possible admixt. with aromatic rings. If aromatic acids are absent, at least 5 naphthene ring closures are indicated in some of these acids. The acids are substantially monobasic.

P. J. Wilson, Jr.

Conversion of naphthenic acids to naphthene hydrocarbons. Chemical constitution. Gilbert E. Goheen. *Ind. Eng. Chem.* **32**, 503–8(1940).—A fraction of naphthenic acids isolated from the lubricating oil portion of a Gulf Coast crude petroleum had an av. mol. wt. of 317 and an av. mol. formula of $C_{20.7}H_{38.2}O_{2.1}$. The corresponding naphthene hydrocarbons were prepd. from these acids by way of the Et esters, alcs. and iodides. These hydrocarbons had higher viscosity indexes than those of a typical naphthene-base oil. Evidence was obtained to indicate that the acids were monobasic compds. contg. on the av. about 2.6 rings per mol. No more than about 5% by wt. of aromatic material was present. P. J. Wilson, Jr.

The production of high-speed Diesel fuel from Fushun shale oil. IX. Comparison of the ignition qualities of crude petroleums and crude shale oil. Koki Isibasi. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 428–9 (1939); cf. *C. A.* **33**, 3571[9].—Two shale oils (refined by washing with acid and soda) and gas oil cuts (b. 200–360°) from 5 representative Japanese and 2 foreign crude petroleums, 1 oil from the liquefaction of coal and 2 low-temp. tars were examd. The d_4^{20}, aniline point, Diesel index, av. b. p., cetane no. (CFR motor method) and compn. (percentage of unsatd. compds., aromatic compds., naphthenes and paraffins) of the cut b. 200–300° are

tabulated. The cetane nos. were over 50 for paraffin-base crude oils, 40 to 50 for mixed paraffin-naphthene-base crude oils, and under 40 for the naphthene and tar-base crude oils. Aniline points and cetane nos. were obtained (values not given) on 7–8 20° cuts on these gas oils and were found to be closely related. Ignition quality (I) for any main cut was almost the av. of the values for the 20° cuts. Except for the first fraction, all the fractions of shale oil had uniform I, comparable to those of paraffin-base crude oils. B. p. affects I of refined oils from a given crude oil because different constituents are present in the different boiling ranges. **X. Comparison of the ignition quality of petroleum and shale Diesel oils.** *Ibid.* 429.—Fifteen straight-run and cracked Diesel fuels were examd. The oils had sp. grs. between 0.84 and 0.88, aniline points 44 to 68, and cetane nos. (CFR motor method) 38 to 53, the high cetane oils being highly paraffinic. The following oils were fractionated into 4 to 7 20° cuts (for each of which cuts are tabulated b. p., percentage of total cut, d_4^{20}, aniline point and cetane no.): a shale oil, a paraffin-base petroleum oil, a paraffin-naphthene-base petroleum oil, a cracked shale oil and a cracked petroleum oil. Except for the first and last fractions, ignition quality (I) of straight-run petroleum oils increases with b. p., is remarkably const. for straight-run shale-oil fractions, and is const. up to about b. 240° after which it decreases rapidly for both cracked petroleum and cracked shale oils. Conclusion: I is influenced by the treatment of the crude oil and the b. p. of the fractions. **XI. The ignition quality calculated for shale oil.** *Ibid.* 429–30.—The d_4^{20}, surface tension, sp. parachor and av. b. p. of straight-run, cracked, solvent-refined and hydrogenated shale oils and straight-run and cracked petroleum oils were detd. and the data used to calc. the cetane no. by the sp. gr. and sp. parachor methods of Heinze and Marder (cf. *C. A.* 32, 1437[4]). The cetane nos. calcd. by the second method are in good agreement with the exptl. values for both types of oils, but as much as 5 cetane no. difference was obtained with the sp. gr. method on shale oils. All the data are tabulated. **XII. The ignition quality of the constituents of shale oil.** *Ibid.* 430.—A cracked shale oil and a straight-run petroleum oil were sepd. into olefins, aromatic compds., cycloölefins, naphthenes and paraffins by selective solvents (Steinbrecker's method, *C. A.* 31, 8898[5,7,9]) and percentage sol. in H_2SO_4, cetane no. and Conradson carbon were detd. for each constituent sepd. by the solvents; the data are shown in 2 tables. The cracked shale-oil (cetane no. 49.1) contained 8.7% olefins (cetane no. about 22), 14.5% cycloölefins (cetane no. −10.5), 12.0% aromatic compds. (cetane no. 35.8), 44.1% naphthenes (cetane no. 59.6) and 17.2% paraffins—probably largely straight-chain compds. (cetane no. 117.3). The olefins and aromatic compds., which have a high sp. gr., n, and Conradson carbon, could be removed easily by treating the cracked shale oil with H_2SO_4. **XIII. The production of maximum high-speed Diesel oil.** *Ibid.* 430–1.—Crude shale oil on distn. gives 45% gas oil b. below 340°, the "light fraction" from which (a Diesel-oil (I), b. 200–340°) after refining with H_2SO_4 has the following properties: d_4^{20} 0.8435, η 36.4 Saybolt Universal sec. at 38°, solidifying point −4°, av. b. p. 287.5, cetane no. 55. The heavy shale-oil fraction, b. above 340°, can be cracked by distn. at 10–15 kg./sq. cm. and 400–420° to yield approx. 18% finished gasoline (II), 44% finished Diesel-oil (III), 19% "pitch" and 6% gas and loss. After refining II has the following properties: sp. gr. 0.7315, initial b. p. 28.5°, 10% point 75°, 50% point 122.5°, 95% point 191°, end point 215°, octane no. 50.5. III has the following properties after refining: sp. gr. 0.8430, η 35.8 Saybolt Universal sec. at 38°, solidying point +4°, Conradson carbon 0.08%, av. b. p. 291.8, aniline point 64.3°, Diesel index 52.1, cetane no. 59. III requires less acid refining than I. Accordingly, a max. of approx. 60% high-quality Diesel oil and about 10% low-grade gasoline can be obtained from Fushun shale oil. The properties of various straight-run Diesel cuts, one cracked cut and a 50–50 straight-run and cracked Diesel blend, are tabulated as well as the properties of the crude and refined cracked Diesel oil. A flow plan shows the conditions of the distn. and cracking process together with the yields at each step.

Anna Louise Nestmann

Analysis of high-molecular hydrocarbons by means of physical-chemical measurements. Richard Heinze, Maximilian Marder and Herbert Pohl. *Mitt. Ges. Braunkohlen- u. Mineralölforsch. Tech. Hochschule Berlin* No. 12, 60–75(1936); *Chem. Zentr.* 1938, I, 4561.—The detn. of the phys.-chem. characteristics offers the best possibility of detg. the constitution and compn. of the hydrocarbons and hydrocarbon mixts. occurring in petroleum and tars. The additive character of the phys. properties as well as the great accuracy with which they can be measured makes it possible to express the compn. of a mixt. from a knowledge of the properties of the constituents and the phys. data on the mixt. The density, aniline point, viscosity, n, mol. refraction and parachor were investigated to det. their suitability for estg. the compn. of such mixts. of high-mol. hydrocarbons. Side chains and rings are quantitatively expressed in the parachor since they influence its magnitude; its use offers the possibility of establishing the finer mol. structure of the constituents of the mixt. Data experimentally obtained in specific cases for the parachor, aniline point, course of the viscosity, and specific refraction are presented in tables and curves and compared with calcd. values. Beside the parachor, the values for mol. refraction are especially valuable in detg. constitution. Studies are reported on some com. paraffins, a ceresin obtained from Boryslaw ozocerite, hard paraffin produced by the Fischer-Tropsch synthesis, and highly refined paraffin oil. The consts. for calcn. of the parachor were detd. on paraffin-petroleum mixts. of varying concns., from which the parachor of paraffin was obtained by extrapolation. The exptl. findings agree with generally accepted ideas regarding the structure of the materials investigated. In the Boryslaw ceresin, branching of the C chain was qualitatively and quantitatively demonstrated (on the av., about 3 side chains per mol.) Com. paraffin was recognized (from the exptl. results) as a normal, satd. aliphatic hydrocarbon; paraffin oil, as a mixt. of naphthenes. M. G. Moore

Suggest correlation of gas gravity and gasoline content. K. Davison. *Oil Gas J.* 38, No. 39, 54(1940).—A chart is given relating the sp. gr. of natural or casinghead gas and its gasoline content. W. Andrew Wright

Determination of saturated hydrocarbons. Aliphatic, aromatic and hydroaromatic hydrocarbons of the cyclohexane series. E. Berl and W. Koerber. *Ind. Eng. Chem., Anal. Ed.* 12, 175–6(1940).—The mixt. is nitrated with a mixed acid composed of 55% H_2SO_4, 25% HNO_3 and 20% H_2O; thus the aromatic hydrocarbons are converted into mononitro derivs. which are sol. in the mixed acid; the other compds. are not affected. Dehydrogenation of the original mixt. by passing it over a specially prepd. Pt catalyst converts the hydroaromatic compds. into aromatic compds. and subsequent nitration of the resulting mixt. gives a measure of the sum of the 2 types of compds. The material unattacked in the second nitration represents the aliphatic compds. present in the original mixt. Special app. is described for carrying out the detn. of 2.5–5 cc. of sample. The method cannot be used in the presence of unsatd. aliphatic hydrocarbons.

T. H. Dunkelberger

Dehydrogenation and nitration of hydrocarbons of the cyclopentane series. E. Berl and Regis Raab. *Ind. Eng. Chem., Anal. Ed.* 12, 177(1940); cf. preceding abstr.—Cyclopentane and methylcyclopentane are practically unattacked by the mixed nitrating acid and show practically no dehydrogenation when submitted repeatedly to the catalytic treatment of Zelinskiĭ (*C. A.* 7, 2224) at 325° and 385°. This is contrary to the action of members of the cyclohexane series. T. H. Dunkelberger

Physical constants of asphaltic bitumens. I. R. N. J. Saal, W. Heukelom and P. C. Blokker. *J. Inst. Petroleum* 26, 29–39(1940).—*Sp. gr.* The sp. gr. of bitumens having a penetration at 25° greater than 5 was detd. by means of a pycnometer, that of harder bitumens by means

of a Mohr balance; for residual and blown types the sp. gr. increased with hardness from 1.01 ± 0.02 for a bitumen of 300 penetration to 1.07 ± 0.03 for one of less than 5 penetration. For bitumens prepd. from cracked residues the sp. gr. varies from 1.13 ± 0.02 for a bitumen of 100 penetration to 1.16 ± 0.02 for one of less than 5 penetration. *Coeff. of cubical expansion.* By means of the instruments used for dètn. of sp. gr., straight-run bitumens, for the temp. range 15–200°, were found to have practically a const. coeff. of cubical expansion; this coeff. seemed to increase slightly with the hardness of the bitumen, varying from 0.00060 (penetration of 196) to 0.00062 (penetration of 23). *Sp. heat.* A new app. was devised, consisting of a small bucket-like container for the bitumen brought to the predetd. temp. in a vertical Cu tube entirely surrounded by the vapors from a boiling liquid; the container is dropped through a hole into a Cu block bored to receive it and also provided with a lid. The Cu block is contained in a double-walled calorimeter provided with H_2O circulation. After calibration of the Cu block with a Ag block of the same dimensions as the container sp. heats at 100, 200 and 300° were run on different bitumens. Data show that sp. heat increases with temp. and is a linear function of the temp.; it follows that a transition point, and consequently a definite m. p., does not occur. Among the values reported are the following for sp. heat$_0$ (cal./g./°C.) and a (change of sp. heat/°C.), resp.: for Venezuelan distd. bitumen of 177 penetration, 0.425, 0.00047; for the same bitumen of 7 penetration, 0.382, 0.00073; for distd. Mexican bitumen of 22.5 penetration, 0.429, 0.00035; for blown Mexican of 39 penetration, 0.430, 0.00032; for blown Mexican of 25 penetration, 0.402, 0.00056; for bitumen from cracked residue, of 2 penetration, 0.449, 0.00040. *Thermal cond.* The app. consisted of a small Cu sphere, provided with a heating element and a thermocouple, placed in the center of a larger hollow sphere immersed in a H_2O-bath, the space between the solid sphere and the inner wall of the larger sphere being filled with the bitumen under test. Data show that thermal cond. decreases with temp. from 0° to 70°, and for the same bitumen, increases slightly with the hardness; typical values for a distd. Mexican bitumen of 22.5 penetration are 0.137 at 0° and 0.131 at 60° in kg.-cal./m./°C./hr. *Surface tension and total surface energy.* The app. consisted of a du Noüy app. run in an atm. of H_2. The surface tension decreased with increase in temp.; the total surface energy varied between 50 and 52 ergs/sq. cm. for the 6 bitumens tested; a distd. Mexican of 50 penetration had a surface tension of 26.2 dynes/cm. at 150° and 34.2 at 25° (obtained by extrapolation); its total surface energy was 52 ergs/sq. cm. *Permeability to H_2O vapor.* The authors did not det. this property but reported values found by other workers, which agree fairly well; Badum (*C. A.* **33**, 9486[7]) gives 1.4×10^{-8} g./hr./cm./mm. Hg as the diffusion coeff. 13 references and 6 tables. Henri Marc

Chemical research laboratory of the Ethyl Gasoline Corporation. Harold A. Beatty. *Ind. Eng. Chem., Anal. Ed.* **12**, 185-6(1940). G. G.

Temperature coefficient of preflame reactions and the knocking value of motor fuels. A. S. Sokolik. *Acta Physicochim. U. R. S. S.* **11**, 379–402(1939)(in English).—For spontaneous ignition of various hydrocarbon-air mixts., the relation of time lag to temp. is given by $te^{-\gamma/T} = C$ for the lower temp. zone and by $tp^n = c$ for the upper temp. zone (t = time lag, γ = temp. coeff., T = critical temp. of spontaneous ignition, p = critical pressure of spontaneous ignition, n = order of reaction). From exptl. data on ethane, propane, propylene, heptane, octane, isooctane and diisopropyl ether as well as some other fuels, S. finds that the tendency of a fuel to knock is greater the greater the temp. coeff. of the preflame reaction, or (in the low-temp. zone) the higher the pressure. The behavior of a fuel can be predicted from $\gamma(1 - (1/\epsilon_{crit.}\ 0.32)) = A$. The calcd. and exptl. crit. compression ratios $\epsilon_{crit.}$ are, resp.: octane 2.2, < 2.8; heptane 2.6, 2.8; hexane 3.0, 3.3; pentane (mixt.) 4.0, 3.8–5.7; propane 12.3, 12; propylene 9.6, 8.4; ethyl ether 3.3, < 3.9; CS_2 5.3, > 5.15. The temp. coeffs. detd. as above are the av. values for the complete oxidation process rather than for any single definite reaction, and are a measure of the accumulation or destruction of the intermediate active products. For $(iso\text{-}Pr)_2O$, γ is negative at 280°. F. H. Rathmann

High antiknock "safety" aviation fuel. M. G. Van Voorhis. *Refiner, Natural Gasoline Mfr.* **19**, 19–21 (1940).—A general discussion, based on the papers presented at the Am. Petroleum Inst. meeting, Nov., 1939. C. H. Brooks

Octane number as a function of the boiling range of gasolines. Manole Cosmin. *IIme Congr. mondial pétrole* **3**, Sect. 4, 760–8(1937)(in French).—Gasolines produced from Rumanian crude oils have been divided into 3 groups: (1) straight-run gasolines from paraffinic oils having an octane no. of 55–70 and b. 20% at 10° and 85% at 100°; (2) gasolines from nonparaffinic oils having the same boiling range as gasolines in (1) and having an octane no. of 60-73; and (3) cracked gasolines of 65–70 octane no. having a close boiling range, about 39–40% distg. at 100°. Each straight-run gasoline was distd. into some 10 narrow fractions and the octane no. of each fraction was detd. By plotting the octane no. *vs.* A. S. T. M. distn. for each of the gasolines, a set of curves is obtained showing the relation between octane no. and b. p. at the following temps.: 90, 100, 110, 120, 130 and 140°. The curve is a straight line for paraffin base gasolines at 100°, and for naphthenic base gasolines at 130°. Properties of gasoline are given. E. J. Mahler

A study of knocking in Otto engines by means of electroacoustic measuring devices. Albert W. Schmidt and Kurt Generlich. *Deut. Kraftfahrtforsch.* No. **33**, 15 pp. (1939).—An electroacoustic method for measuring the knock intensity is described, in which the noises received by the microphone are amplified and converted into optical signals by means of a Braun tube. The range of amplitudes obtained with these oscillograms covers all intensities of knock originated by the motor fuel. Since the app. is not in immediate communication with the combustion chamber, no drilling of bores in the cylinder head is necessary, and knock measurements can be made in any one of the cylinders of a multiple-cylinder engine with a single setup. It has been found that individual differences in the fuel supply on the suction stroke, slight differences in the ignition timing and configuration of the cooling jacket around each cylinder account for individual differences in the octane no. detd. for the various cylinders. Bruno C. Metzner

Cylinder and piston-ring wear. Georg Beck. *Deut. Kraftfahrtforsch.* No. **29**, 11 pp.(1939).—Accurate measurements of the wear of piston rings and cylinder walls in gasoline engines show that wear is greatest when the engine operates in the cold, especially with frequent starting. Rupture of the lubricant film and corrosion are the main causes. Thermal breakdown of the film is responsible for wear at high temps. Progressive aging of the oil also increases the wear. Paraffin-, asphalt-, naphthene- and mixed-base oil ranged in this order with reference to increased wear of piston rings. An addn. of castor oil and graphite to the mixed-base oil proved to be of advantage, particularly for the first ring. The addn. of tetraethyl lead or iron carbonyl to the motor fuel increases the wear. A rapid wear-testing method based on measurement of the strength of elec. current passed to each of the piston rings and back through the cylinder wall appears to be promising. Bruno C. Metzner

Coöperative research and standardization for automotive petroleum products in the U. S. C. B. Veal. *IIme Congr. mondial pétrole* **4**, Sect. 5, 293–306(1937)(in English).—The activity of the Coöperative Fuel Research Comm., the Soc. of Automotive Engineers and the American Soc. for Testing Materials, CFR, SAE and ASTM, resp., with regard to organization, present and past projects is explained. A bibliography of CFR and SAE research work is appended, together with a list of recent ASTM standards. E. J. Mahler

Lubrication of internal-combustion engines. Paul

Marchand. *J. soc. ing. automobile* **12**, 353–63(1939).— Improper lubrication in internal-combustion engines may be due to chem. or phys. changes in the lubricant, corrosion of mech. parts by impurities present or formed in the lubricant, faulty mounting or poor maintenance of the engine. Crankcase diln., C and varnish deposits, formation of emulsions and overheating of bearings are the typical causes discussed in detail. Bruno C. Metzner

A critical investigation of the basic principles of viscosity and a special lubricating process. H. Brillié. *Bull. assoc. tech. marit. aéronaut.* No. 41, 105–29(1937); *Chem. Zentr.* 1938, I, 4404; cf. *C. A.* **32**, 6848[8].—The results of a series of exhaustive investigations in the National Phys. Lab. (Teddington) on the friction of lubricating films are in good agreement with the general laws of friction. It is shown, however, that the coeff. of friction corresponds better to some property of the film other than its observed thickness. An attempt is made to explain this contradiction by a new development of the fundamental differential equation of Reynolds. Such a treatment indicates that the oil film between 2 moving parts consists of 2 parts. One of these is a region promoting the lubricating action, in which the counter-pressure as well as the passive resistance acts. The 2nd is a region in which only the injurious frictional resistance acts. It is shown how this latter effect can be reduced by suitable shaping of the bearings, longitudinal grooves, etc. M. G. Moore

The static friction of lubricated surfaces. A. Fogg and S. A. Hunwicks. *J. Inst. Petroleum* **26**, 1–18(1940).— The "boundary lubricating" properties or "oiliness" of various substances were obtained by means of a modified Deeley machine in which the 3 flat pegs resting on the disk were replaced by 3 balls, 1/2 in. in diam. F. and H. experimented with various methods for cleaning the steel surfaces and found that by rubbing the friction surfaces with "0000 blue black" emery paper the traces of adsorbed oils or cleaning solvents were completely removed. After several hundreds of observations the coeff. of static friction for steel varied between 0.56 and 0.60 with a mean value of 0.58. The following av. values are reported by F. and H. as coeffs. of static friction: *Fatty oils:* castor oil, 0.095 at 20° to 0.105 at 100°; rape oil, 0.105; olive oil, 0.105; coconut oil, 0.08 from 40° to 100°; sperm oil, 0.10; pale whale oil, 0.095; neatsfoot oil, 0.095; lard oil, 0.085. *Mineral oils:* light machine oil, 0.16 at 20° to 0.19 at 100°; motor car engine oil, 0.13 at 20° to 0.15 at 100°; thick gear oil, 0.125 at 20° to 0.15 at 100°; solvent-refined oil, 0.15 at 20° to 0.20 at 100°; extreme-pressure lubricating oils, from 0.09 to 0.10 with practically no variation with temp.; graphited oil, i. e., solvent-refined oil contg. colloidal graphite, 0.15; graphited oil heated and allowed to cool for 24 hrs., 0.125. *Common liquids:* $CHCl:CCl_2$, 0.33; C_6H_6, 0.48; C_2H_5OH, 0.43; distd. H_2O, 0.20 to 0.40; glycerol, 0.20 at 20° to 0.25 at 100°. By compounding solvent-refined oil with rape oil F. and H. found that the friction at 100% rape oil was less than for any mixt. but that for practical purposes approx. 75% of the total possible gain is obtained at 20% rape-oil concn.; similar results were obtained when oleic acid (μ:0.08) is added to Brit. Pharm. paraffin (μ:0.18 at 20° to 0.22 at 100°). P. and H. conclude that with the revised Deeley machine the relative "oiliness" values of lubricants can be detd. with a reasonable degree of accuracy, that this property is not of the liquid in bulk but only of the boundary layer and that it is not connected with viscosity. Henri Marc

Surface-tension measurements of lubricating oils. M. Freund. *Petroleum Z.* **35**, 295–300(1939); cf. *C. A.* **33**, 8459.—The surface-tension-temp. graphs of 6 oils are almost parallel and very slightly convex toward the axes over the range 25–200°. Of specimens of similar origin and prepn., the denser oil has the higher surface tension. The Eötvös const., K, increases at first with mean mol. wt., but approaches a limit of about 5.6 when M = 850. The high values of K may be due to inapplicability of the expression $(M/d)^{2/3}$ for molar surface energy, in the case of long oriented mols. such as the higher paraffins; they fall slowly as temp. rises. B. C. P. A.

Asphalt in motor [engine lubricating] oils. Edmund Graefe. *Petroleum Z.* **35**, 178–9(1939).—Asphalt does not accumulate in the oil provided that suspended impurities (metal particles, C deposit, road dust, etc.) are continuously removed, because the asphalt is adsorbed by, and removed with, the C. Aging tests where no C is present do not represent actual conditions. B. C. P. A.

Lubricating power [of oils]. E. H. Kadmer. *Petroleum Z.* **35**, 171–8, 271–7(1939); cf. *C. A.* **33**, 4775[4].—The merits of the Thoma testing machine (*C. A.* **33**, 364[2]) are pointed out and the results of tests on a large no. of oils adjusted by temp. control to 2 standard values of η are given. Satisfactory relative values of lubricating power, L, are obtained although tests with several metals and alloys show that they are affected by the nature of the rubbing surfaces. Thirty-eight mineral oils show a roughly linear relationship of d_{20} to L which, however, is greatly influenced by refining so that over-refined oils notably have low values of L. Four synthetic oils have low d. compared with mineral oils of equal L. Three oils of high S content have high L compared with normal oils of equal d., and the latter are improved by adding S in various forms. Fatty oils show high L, but there is no correlation with d. B. C. P. A.

Extraction of mercaptans with alkaline solutions. D. L. Yabroff. *Ind. Eng. Chem.* **32**, 257–62(1940).—The differences in extractability of the various mercaptans from an oil (or gasoline) phase by an aq. soln. are due almost entirely to differences in soly. of the unneutralized mercaptan in the aq. phase, rather than to differences in the acidity of the mercaptans. As the NaOH concn. in the aq. phase increases, the improvement in extn. is less than might be expected, owing to the salting-out of the unneutralized mercaptan from the aq. phase by the NaOH. The extent of extn. increases as the temp. is lowered, essentially because of decreased hydrolysis of the mercaptide in the aq. phase. The extn. const. Kq, or the equil. ratio of total mercaptan and mercaptide concn. in the aq. phase to that in the oil phase, is expressed in terms of the partition and ionization consts. and readily estd. data. Kq for various mercaptans between approx. 0.5 N NaOH and isooctane at 20°: ethyl, 77.9; propyl, 15.6; butyl, 3.6; *tert*-butyl, 2.46; amyl, 0.753; *tert*-amyl, 0.362; heptyl, 0.0342. The effects of temp. on the overall extn., partition, ionization and hydrolysis correspond to heats of reaction of −7400, −600, 6800, and 6800 cal. per g.-mole, resp. "Solutizers," or org. addns., increase the soly. in the aq. phase, and some give rather remarkable results on the com. scale. Twenty-six references. R. W. Higbie

Improvement in octane number and lead susceptibility. D. L. Yabroff and A. C. Nixon. *Oil Gas J.* **38**, No. 41, 74–6(1940); *Natl. Petroleum News* **32**, R-56-62(1940).—Sulfur compds. decrease octane nos. as well as lead susceptibility. Polysulfides are more detrimental than mercaptans in this respect. Conventional sweetening methods convert mercaptans to disulfides and polysulfides to some extent, resulting in lowering of octane no. and lead susceptibility. Extg. sulfur compds. in Solutizer soln. (6 N KOH, 3 N K isobutyrate) yields gasoline with improved octane rating compared to the sour gasoline and permits lowering of leading costs. W. Andrew Wright

Petroleum refineries, including cracking plants, in the United States, January 1, 1939. G. R. Hopkins and E. W. Cochrane. *U. S. Bur. Mines, Circ.* 7091, 29 pp. (1939). Alden H. Emery

Nomenclature of technical terms used in the petroleum industry. *IIme Congr. mondial pétrole* **4**, Sect. 5, 105–260(1937).—Tech. petroleum terms are listed alphabetically in English, and their German and French equivs. are given in sep. columns. The dictionary includes terms in all branches of the industry. E. J. Mahler

Nomenclature of extraction processes. II. A. W. J. Mayer. *IIme Congr. mondial pétrole* **4**, Sect. 5, 271–9 (1937); cf. *C. A.* **32**, 7790[8].—Nomenclature of American

and British processes is held untenable. A classification of the extn. processes into elementary and multiple processes is drawn up. The term "continuous" extn. is discussed. New definitions are given for "non-intermittent," "intermittent," "batch" and "continuous" processes. A study of the methods of flow in extn. processes has led to the new conception of "cross-stream" flow. Gradual and multiple processes are discussed. All the processes are described in French, German and English terminology. E. J. Mahler 1

Cracking coal-oil distillates. Gustav Egloff, G. B. Zimmerman, J. C. Morrell and W. E. Lemen. *Oil Gas J.* **38**, No. 35, 36, 39, 52, 53(1940).—A pilot plant cracking coal-oil distillate from a South Yorkshire bituminous gas coal is described. The properties of the original distillates and cracking plant products are given, together with operating conditions and yields. A 78 octane gasoline was produced. W. Andrew Wright 2

Gas-recovery system installed by Kendall. J. P. O'Donnell. *Oil Gas J.* **38**, No. 39, 34, 35(1940).—A description of the equipment. W. Andrew Wright 3

Sample computations of natural gasoline absorber data. R. H. Turner. *Petroleum Engr.* **10**, No. 3, 54, 56, 58 (1938); cf. *C. A.* **33**, 6034⁴.—Bubble-tower capacity depends on the distance between trays and plates, mol. wt. of the gas, operating pressure, quantity of liquid passing downward, and depth of liquid on the plates. Typical calcns. are given of the allowable cap velocity and the capacity of an absorber under specified conditions. B. C. P. A. 4

The petroleum industry in France. I. Introduction. Ernest Mercier. *Mém. soc. ing. civils France* **92**, 82–9 (1939).—An economic review. **II. The petroleum-refining industry and its recent evolution in France.** X. Normand. *Ibid.* 90–101. A general review of refining processes, with statistics. **III. Fuels, lubricating oils and pitches from the point of view of the producer and consumer.** Jacques André. *Ibid.* 102–10.—An economic review. **IV. Liquid fuels as the essential goal of the petroleum industry.** P. Dumanois. *Ibid.* 111–23.—A discussion of standards for gasolines and gas oils. **V. Distillation, cracking, reforming; general principles.** P. Minard. *Ibid.* 124–40.—The evolution of these processes is discussed. The operation of the combination distg. and cracking plant at Martigues is described. This plant combines the following features: (1) max. production of gasoline compatible with a very concd. liquid cracking residue, (2) polymerization of 3- and 4-C hydrocarbons of the cracking gases, with increased gasoline yield, (3) sepn. of cracked gasolines into 2 fractions, (4) concn. of the heavy pitch constituents and production of good quality fuel oil of low S content. **VI. Chemical synthesis in the petroleum industry; polymerization, cyclization, manufacture of lead tetraethyl.** Jacques Barbière. *Ibid.* 141–53.—The production of high octane gasoline by polymerization of the olefins of cracking gases in presence of H_2SO_4 or P_2O_5 and by catalytic reaction between the olefins and paraffins of these gases, as developed by the Shell and Standard Oil companies, is described. Low yields of iso- compds. are obtainable by isomerization of paraffins and olefins in presence of metallic chlorides or P_2O_5. Catalytic cyclization of aliphatic hydrocarbons is discussed and the manuf. of $PbEt_4$ is described. **VII. The role of scientific research in the education of petroleum engineers.** H. Weiss. *Ibid.* 154–61. **VIII. Conclusion.** P. Pineau. *Ibid.* 162–5. M. M. Flannery 5 6

Burning of sulfur-containing Ishimbajev mazut in admixture with gaseous fuels in Martin furnaces. I. G. Arsamaszev and S. M. Shegal. *Ural. Met.* **1937**, No. 4, 39–43; *Chem. Zentr.* **1938**, I, 4557.—When the smelting is carried out with Ishimbajev fuel oil (2–3% S) in mixts. with gaseous fuels, the metal produced contains only up to 0.04% S. The fuel oil consumption amounts to up to 6%; the S content of the combustion gases amounts to as much as 0.85 g. per cu. m. M. G. Moore 7

Application of x-ray inspection to oil-refining equipment. Herbert R. Isenburger. *Refiner Natural Gasoline Mfr.* **19**, 22–9(1940).—X-ray inspection of castings, forgings, etc., will show defects (size and location), which might be overlooked otherwise. A brief description of the technique used is included, together with exposure charts for steel. C. H. Brooks 8

The development of the pit-kilns for the carbonization of wood. Fritz Fromm. *Wien. allgem. Forstztg.* **55**, 165–6 (1937).—A review of the Austrian patents on this field. 2 drawings. F. Fromm 9

The utilization of waste timber and waste lumber. Fritz Fromm. *Wien. allgem. Forstztg.* **55**, 67–8(1937).—A short report of the studies of Austrian committees on the production of glucose, oxalic acid and charcoal from wood. A transportable metallic kiln (constructed by A. Hölzel) for the carbonization of wood is described. It works automatically and yields 18–20% charcoal. F. Fromm 10

Wooden rosin barrels. J. B. Cuno. *U. S. Forest Products Lab.*, Mimeographed Rept. **1939**.—C. discusses the advantages to naval stores industry of continued use of the wooden rosin barrel, describes weaknesses in the present type because of shrinkage, improper wood, faulty manuf. and assembly, and gives detailed recommendations with several illustrations, for an improved wooden barrel. C. E. Curran 11

The chemical wood industry in Austria. Rudolf Scheuble. *Centr. ges. Forstwesen* **64**, No. 1, 1–31(1938); *Chem. Zentr.* **1938**, I, 4253–4.—A review. Topics considered include the lignocellulose industry, the resin and turpentine industry, charcoal burning, the production of wood gas, etc. The wood required by these industries is also considered. M. G. Moore 12

Chemistry in the Forest of Dean. Wood carbonization still holds out. M. Schofield. *Ind. Chemist* **16**, 65–9 (1940).—Wood distn. is described. E. H. 13

Gas measurements over petroleum deposits (Selzer, Weber) **8**. Bituminous protective coatings for buildings (Becker) **20**. Detn. of petroleum products in crude and rectified alc. (Kotlyarenko) **16**. Effect of petroleum products on Neoprene vulcanizates (Fraser) **30**. Method for extinguishing burning petroleum products (Bezuglov) **24**. Hydrogenation of coal and petroleum (Valverde) **21**. Phase diagram of mixt. of natural gas and natural gasoline near crit. conditions (Katz, *et al.*) **2**. Metals in drilling (Nelson) **9**. Skin-protecting compn. [from effects of petroleum products] (Russ. pat. 56,097) **17**. Artificial resins [from acid sludge] (Russ pat. 56,044) **13**. App. for regulating flow of oils (U. S. pat. 2,185,970) **21**. Sepg. solid-oil mixts. (Brit. pat. 508,849) **21**. Polymerizing fatty oils [for use in lubricants] (U. S. pat. 2,184,957) **27**.

Evaluation of Petroleum Products. Philadelphia: Am. Soc. for Testing Materials. 52 pp. 75 cents.

Conversion of petroleum oil. Philip S. Nisson (to Pure Oil Co.). U. S. 2,185,516, Jan. 2. An arrangement of app. is described, and a method of converting crude oil into motor fuel of high octane rating which comprises sepg. crude oil into a vapor and a liquid fraction without cracking the oil, simultaneously cracking the vapors in a vapor-phase-cracking stage and the unvaporized liquid in a liquid-phase-cracking stage, sepg. cracked vapors from unvaporized residue in both cracking stages, commingling and fractionating the vapors, separately withdrawing the unvaporized oil produced in the liquid-phase-cracking step from the system without further cracking, withdrawing unvaporized residue from the vapor-phase cracking and recycling it to the liquid-phase-cracking stage, withdrawing and cooling condensate formed in the fractionating stage and fringing the products issuing from the vapor-phase-cracking stage into contact with the cooled condensate.

Hydrogenating heavy petroleum oils. Elbridge W. Stevens (to Wachovia Bank and Trust Co.). U. S. 2,185,070, Dec. 26. An arrangement of app. is described,

and a process of converting heavy petroleum oil fractions to lighter fractions, which comprises vaporizing the heavy oil fractions, mixing the heated vapor with H gas, passing the vapor-gas mixt. through a space encircled by a catalytic material, producing a high-frequency silent dark discharge of elec. current through the space, raising the temp. of the vapor-gas mixt. so treated above the original temp. of the vapor while maintaining the treated vapor-gas mixt. below 360° and again passing the vapor-gas mixt. through a high-frequency elec. field forming a silent dark discharge in a space enclosed by a catalytic material, such as a mixt. of Al, Fe and Zn.

Ethylene from hydrocarbon material such as petroleum oils. Frank Porter and John M. Duncan (to Solvay Process Co.). U. S. 2,185,566, Jan. 2. App. is described, and a method of operating a pair of refractory regenerative units, A and B, for cracking hydrocarbons to produce C_2H_4.

Separating naphthenic and other organic acids from oily materials such as petroleum oils. Arthur Lazar and Lionel S. Galstaun (to Tide Water Associated Oil Co.). U. S. 2,186,249, Jan. 9. A process of sepg. org. acids from oily material contg. the same comprises treating the material with a basic reagent of higher volatility than the acids whereby soaps are formed and at a temp. below that at which amides tend to be formed, sepg. the soaps from the oily material, then dissocg. the soaps by distn. to recover separately the org. acids and basic reagent. NH_3 or an alkylamine or alkylolamine may be used as the basic reagent.

Rendering mineral oils resistant to oxidation. Adrianus J. van Peski (to Shell Development Co.). U. S. 2,184,944, Dec. 26. A process of improving the resistance to oxidation of a mineral lubricating or insulating oil involves selectively hydrogenating an aromatic, liquid SO_2-sol. ext. of a mineral lubricating oil contg. olefinic and nonhydrocarbon impurities under conditions to eliminate at least a major portion of the impurities and to produce a purified aromatic ext., and adding a small amt. of the latter to the mineral oil.

Extraction of asphalt-free hydrocarbon mixtures. N. V. de Bataafsche Petroleum Maatschappij (A. W. J. Mayer, inventor). Dutch 47,238, Dec. 15, 1939. Hydrocarbon mixts. such as lubricating oils or gasolines are sepd. into components of diff. H contents by extn. with mixts. of anhydrous selective solvents; one of the solvents is a monosubstituted ring (preferably aromatic), in which the substituent produces a dipole moment of more than 10^{-18} e. s. u.; the other solvent is a cyclic compd. contg. more than one substituent. Examples of solvent mixts. are phenol and resorcinol, nitrobenzene and *p*-nitrophenol, nitrobenzene and 1,2,4-dinitrochlorobenzene. Diluents may be added to oil or solvent; nonpolar cyclic compds. are used for this purpose. The solvents may have the same polar group. Mixts. of aromatic mono- and polyamines made by reduction of nitrated coal-tar hydrocarbons are excepted specifically.

Effecting catalytic conversions such as hydrocarbon treatments. Thomas P. Simpson, John W. Payne, John A. Crowley, Jr. and Clark S. Teitsworth (to Socony-Vacuum Oil Co.). U. S. 2,185,928-9, Jan. 2. Various structural and operative details of an app. with parallel tubes and a surrounding shell, etc. U. S. 2,185,930 relates to a process for effecting the conversion of hydrocarbons into others of the gasoline type, involving passing the hydrocarbons to be converted, in vapor phase, in a plurality of paths through a body of contact material while maintaining all portions of the contact material and contacting vapor within a temp. range where substantial conversion of the hydrocarbons will take place with resultant deposition of a contaminating combustible substance upon the contact material, continuing such passage of hydrocarbons and the conversion thereof until the deposit upon the contact material renders it inefficient and regeneration is desirable, removing vapor products from contact with the contact material, passing combustion-supporting gas through the used contact material to effect regeneration thereof *in situ* by blowing the gas through the body of contact material in the form of thin streams sufficiently thin in at least one dimension to maintain the temp. difference between portions of the contact material across transverse sections of respective thin streams within a range not exceeding the difference between a min. temp. at which the burning of the contaminating deposit occurs and a max. temp. above which substantial damage to the contact material occurs and being of a length several times their narrowest cross-sectional dimension, and continuously removing heat from the burning areas within the contact material to maintain the temp. thereof below that at which substantial damage occurs, by maintaining a heat-control medium in indirect heat-exchange relationship with the contact material. App. is described, and U. S. 2,185,931 relates to app. for use and regeneration of catalytic material so used.

Vapor-phase hydrogenation of olefin polymers. Jan D. Ruys and Ewald D. Pyzel (to Shell Development Co.). U. S. 2,184,930, Dec. 26. A mixt. of olefin and H is passed through a catalyst until the portion of the catalyst that first comes into contact with the mixt. is decreased in activity by catalyst poisons to a predetd. degree, then the direction of the mixt. is reversed. By repetition of this procedure the two ends of the catalyst are alternately poisoned and regenerated during the course of the hydrogenation.

Refining aromatic hydrocarbon oils. David F. Gould (to Barrett Co.). U. S. 2,185,406, Jan. 2. A process of refining a hydrocarbon oil from the group consisting of benzene, toluene, xylene or mixts. thereof, solvent naphtha and drip oil comprises adding H_2SO_4 of a strength not exceeding about 70% to the oil, heating the resulting mixt. in the liquid phase, thereafter, without neutralizing acidic constituents in the oil, distg. off the oil, and then neutralizing acidic constituents in the resultant oil distillate.

Refining hydrocarbon oil distillates. Warren W. Johnstone (to Universal Oil Products Co.). U. S. 2,185,768, Jan. 2. For refining, with removal of mercaptans, etc., but without removing deterioration-inhibiting materials, a distillate such as one from a cracking process is treated with an aq. Pb acetate soln. of PbO (suitably a 10–30% soln.) and the aq. and oil layers formed are sepd., S is added to the oil layer to convert substantially all oil-sol. Pb mercaptides into Pb sulfide and dialkyl disulfides, and the treated distillate is recovered.

Extraction process for separating different constituents of hydrocarbon oils. Johannes A. Buchel and Reyerus N. J. Saal (to Shell Development Co.). U. S. 2,185,291, Jan. 2. For sepg. an oil such as a mineral lubricating oil into portions of "different degrees of paraffinicity," use is made of a selective solvent for nonparaffinic hydrocarbons such as furfural in the presence of $CHCl_3$ and the liquid ext. and raffinate phases are sepd.

Cracking hydrocarbon oils. Victor Stapleton (to Texas Co.). U. S. 2,185,041, Dec. 26. An arrangement of app. is described, and a process which involves heating a confined stream of condensate oil to a cracking temp. above 480° to effect a high rate of cracking per pass, directing the stream of cracked products into an enlarged cracking chamber wherein sepn. of vapors from liquid takes place, maintaining a cracking temp. above 455° under superatm. pressure in the enlarged cracking chamber, separately withdrawing liquid from the enlarged cracking chamber at a rate adequate to prevent the accumulation of liquid therein, passing the sepd. vapors without further heating directly into a second cracking chamber below the liquid level therein, introducing fresh charging stock for the process into the system, directing the greater part thereof into a dephlegmating zone in the second cracking chamber above the liquid level therein whereby the stock thus introduced flows countercurrent to the rising vapors sepd. therein and dephlegmates the sepd. vapors before reaching the body of liquid oil, maintaining a large body of liquid oil therein at a cracking temp. of a lower order than that of the first cracking chamber by substantially only the heat derived from the vapors, passing the minor part of the fresh charging stock into the enlarged cracking chamber in proximity to the point of withdrawal of liquid

therefrom to prevent substantial coking at the point, removing the dephlegmated vapors from the dephlegmating zone of the second cracking chamber and subjecting them to fractionation to sep. out a condensate and conducting the condensate to the confined stream.

Cracking hydrocarbon oils. Richard F. Trow (to Texas Co.). U. S. 2,185,162, Dec. 26. An arrangement of app. is described, and a method of cracking which comprises passing a stream of oil such as a gas oil or the like under superatm. pressure through primary and secondary sections of an elongated heating zone of restricted cross section such as a pipe coil and applying heat to the primary section to subject the oil therein to cracking temp. and effect substantial cracking, introducing oil formed as hereinafter specified into the secondary section of the elongated heating zone so that the resultant mixt. of oil and the products from the primary section of the elongated heating zone constitutes the stream flowing in the secondary section thereof, applying heat to the secondary section of the elongated heating zone to subject the stream flowing therein to cracking temp. and continue the cracking, delivering the resultant cracked products from the secondary section of the elongated heating zone to an enlarged sepg. zone maintained under superatm. pressure wherein sepn. of vapors from residue takes place, passing the sepd. vapors to a second elongated heating zone of restricted cross section, wherein the vapors are heated and subjected to vapor-phase cracking, directing the resultant cracked products into a second enlarged sepg. zone wherein sepn. of vapors from residue takes place, passing sepd. vapors from the second enlarged sepg. zone to a primary fractionating zone, withdrawing residue from the first enlarged sepg. zone and subjecting it to flash distn. under reduced pressure to produce a flashed condensate, introducing resultant flashed condensate into the primary fractionating zone wherein fractionation takes place to sep. uncondensed vapors from a fraction comprising reflux condensate and unvaporized constituents of the introduced flashed condensate, conducting the fraction comprising reflux condensate and unvaporized constituents of the flashed condensate from the primary fractionating zone as the oil introduced into the secondary section of the first elongated heating zone, subjecting sepd. vapors from the primary fractionating zone to further fractionation to separate a reflux condensate from lighter products and cycling the reflux condensate to the primary section of the first elongated heating zone.

Cracking hydrocarbon oils. Percival C. Keith, Jr., and Joseph K. Roberts (50% each to Standard Oil Co. of Ind. and Gasoline Products Co.). U. S. 2,185,200, Jan. 2. Numerous details of app. arrangement are described, and a process which involves subjecting crude petroleum in a primary fractionating zone to fractionation to form a residue and a lighter fraction, passing the residue to a primary viscosity-breaking zone wherein the residue is subjected to cracking temp. under conditions to effect the formation of a high yield of gas-oil constituents adapted for conversion into gasoline, directing the viscosity-broken products into a sep. evapg. zone wherein sepn. of vapors from residue takes place. The sepd. vapors are passed into a sep. fractionating zone and subjected therein to fractionation to form a heavy reflux condensate and a lighter fraction; the resultant heavy reflux condensate is passed to a secondary viscosity-breaking zone wherein the heavy condensate is subjected to cracking temp. under conditions to effect the formation of a high yield of gas-oil constituents adapted for conversion into gasoline. The latter viscosity-broken products are sepd. into vapors and residue and the sepd. vapors passed into the sep. fractionating zone. The lighter fractions obtained from the viscosity-broken products and from the crude petroleum fractionation are combined and subjected to cracking in a sep. cracking zone under high-cracking temp. and under conditions of high-cracking per pass to effect conversion to gasoline of high antiknock quality and the resultant products of the latter cracking are directed into a sep. fractionating zone to recover the desired gasoline product.

Cracking hydrocarbon oils. Charles W. Nofsinger and David T. Shaw (to Gasoline Products Co.). U. S. 2,185,222, Jan. 2. Crude petroleum is sepd. in a primary zone into vapors and residue. The vapors are sepd. in a first fractionating zone into gasoline and higher-boiling constituents. The residue is cracked in a primary cracking zone. The products from this zone are sepd. into vapor and residue in a second sepg. zone, and vapors fractionated in a second fractionating zone. Heavy reflux from this zone is passed to a second cracking zone, the products from which are introduced into the second sepg. zone. Vapors in the second fractionating zone are further fractionated to gasoline and intermediate constituents. Gasoline fractions from the first and second fractionating zones are reformed to produce a high-antiknock fuel. Vapors from this process are fractionated in a third fractionating zone, the higher-boiling constituents from which are combined with higher-boiling constituents from the first fractionating zone and the intermediate constituents from the second fractionating zone and sent to a recycling cracking zone.

Preventing corrosion of oil-cracking apparatus by sulfur-bearing petroleum oils. Thomas L. McGee (to Jenkins Petroleum Process Co.). U. S. 2,185,380, Jan. 2. An arrangement of app. is described, and a process for preventing the corrosive action of S-bearing petroleum hydrocarbons toward the metal of the app. in which such hydrocarbons are treated which comprises continuously injecting into the hydrocarbons upon attainment of an initial critical corrosive temp. specific to the hydrocarbons finely divided iron dispersed in a carrier oil of relatively low S content heated to a temp. approx. 83° in excess of the initial corrosive temp. and maintaining such contact while the hydrocarbons exist at a corrosive temp.

Reforming hydrocarbon oil distillates such as gasoline of poor antiknock value. Kenneth Swartwood (to Universal Oil Products Co.). U. S. 2,185,757, Jan. 2. An arrangement of app. is described, and a process which comprises subjecting the distillate in a heating zone to cracking conditions adequate to enhance its antiknock value, sepg. the resulting products into vaporous and nonvaporous components in a sepg. zone, subjecting the vaporous components to fractional condensation to sep. the same into a heavy reflux condensate substantially devoid of gasoline, a lighter reflux condensate contg. high-boiling gasoline fractions, a distillate product contg. substantially all of the low-boiling gasoline fractions in the vaporous products and a normally gaseous product, recovering the distillate product, bringing into contact at least a portion of the gaseous product with the lighter reflux condensate to absorb high-boiling components including propylene and butenes of the former in the latter, subjecting resultant enriched lighter reflux condensate to cracking conditions of temp., pressure and time controlled independently of those employed for the distillate charging stock and adequate to convert the same into high yields of good antiknock gasoline, and subjecting the vaporous products of the last-mentioned cracking step to the fractional condensation, together with the vaporous products of the first-mentioned cracking step.

Desulfurizing gasoline. Alexis Voorhies, Jr., and Eldon E. Stahly (to Standard Oil Development Co.). U. S. 2,185,577, Jan. 2. An arrangement of app. is described, and a process for desulfurizing S-contg. gasoline composed predominantly of olefinic polymers which comprises intimately mixing the gasoline with H_2SO_4 of about 45–75% concn. and at a temp. sufficient to render a substantial part of the acid miscible with the polymers, sepg. the resulting mixt. into a hydrocarbon layer contg. more S than the gasoline originally contained and a H_2SO_4 layer contg. hydrocarbon polymers and less of the S compds. than the polymers originally contained, and recovering from the H_2SO_4 layer a hydrocarbon mixt. boiling within the gasoline range and having a reduced S content.

Motor fuel. Edwin R. Gilliland and Raphael Rosen (to Standard Oil Development Co.). U. S. 2,184,956, Dec. 26. A motor fuel comprising gasoline hydrocarbons is blended with about 10% or more of a glycol or glycerol ether boiling within the gasoline range and having only a single

O atom linked directly to a C atom of an ether group, such as mono- or di-Et ether of ethylene glycol which serves to improve the antiknock properties of the fuel. Cf. *C. A.* **33**, 9589[1].

Apparatus (containing steel wool or the like) for vaporizing liquid hydrocarbon fuels for engines, etc. John H. Seitz (50% to Joseph Fuhringer). U. S. 2,186,152, Jan. 9. Various structural details.

Treatment of alkaline oil-refining sludge. E. A. Eminov and L. N. Frumen. Russ. 51,920, Nov. 30, 1937. Alkali petroleum sludge is treated with a soln. of NaOH of at least 16°Bé., settled, the oil removed, the alkali soln. again treated with at least 16°Bé. NaOH, and settled, and the sepd. naphthenic soaps are treated with kerosene alkali sludge for final sepn. of the oil. The soaps are then sepd. in the usual manner.

Treatment of oil wells. Donald A. Limerick and Howard C. Lawton (to Shell Development Co.). Can. 386,745, Feb. 6, 1940. To clean oil wells from deposits of mixed paraffinic and inorg. matter a liquid comprising an inorg. oxidizing compd. (e. g., water-sol. metal nitrates), a comminuted electropos. metal (e. g., Al or Zn), an aq. soln. of a strong acid reacting with the metal and the inorg. obstructing matter (e. g., HCl or H_2SO_4), and a solvent (e. g., benzene or kerosene) is introduced, heat generated in the well by the interaction of the agents melts the paraffinic matter and the solvent dissolves it, and acid dissolves the inorg. matter.

Sealing off water-bearing formations. Franklin A. Bent, Albert G. Loomis and Howard C. Lawton (to Shell Development Co.). Can. 386,744, Feb. 6, 1940. Brine-bearing formations traversed by a well are sealed off by introducing into the well and forcing into the formation a treating soln. of fluosilicic acid.

Mixed esters. Melvin De Groote (to Petrolite Corp., Ltd.). U. S. 2,184,794, Dec. 26. Esters suitable for use in demulsifying water-in-oil type crude oil emulsions and for other purposes as substitutes for soaps, Turkey-red oils, sulfonated alcs., etc., are produced by treating triricinolein with maleic acid, maleic anhydride or maleyl chloride to produce an acid ester and then treating the acid ester with glycerol to produce a neutral ester, and sulfonating the product with a bisulfite.

Opaque paraffin waxes. Vanderveer Voorhees (to Standard Oil Co. of Ind.). U. S. 2,185,046, Dec. 26. An opaque product is prepd. by heating paraffin wax to above its m. p., dissolving in it about 0.2% or more of a froth stabilizer which may be an alkali sulfonic acid soap, Na stearate, hydroxy ethyl stearate or an alkyl xanthate, in the absence of an aq. medium, and vigorously agitating the resulting mixt. with a gaseous medium such as O, CO_2, N or air while the wax cools to its solidification point.

Filter suitable for use in engine oil circulating systems. Harry R. Tear (to Lubrication Corp.). U. S. 2,185,281, Jan. 2. Various structural details.

Lubricating, insulating and similar oils. Standard Oil Development Co. Brit. 509,071, July 11, 1939. The stability of the oils is improved and their decompn. at elevated temps. prevented by addn. of, e. g., 0.2–5%, of oxidation inhibitors and sludge dispersers of the alkyl thiophosphite class of formula $P(SR)_3$, in which R is alkyl, e. g., triamyl, trihexyl or tributyl thiophosphate. The alkyl radical may contain halogen, e. g., Cl, substituents.

Solvent extraction of lubricating oils. August Schlageter (to Standard Franco-Americaine de Raffinage). U. S. 2,184,961, Dec. 26. An arrangement of app. is described, and a countercurrent solvent treatment of lubricating oils, as with a selective solvent, which involves cooling the ext. phase in a series of cooling stages, removing the cycle oil phase from each cooling stage and returning the first obtained cycle oil to a point approx. the middle of the treating zone and the last obtained cycle oil to a point of the treating zone nearer the extn. end before the first cooling stage, intermediate cycle oils being returned to points intermediate between those into which the first and last cycle oils are introduced.

Recovery of solvents such as sulfur dioxide and benzene used for treating lubricating oils. Edward G. Ragatz and Donald E. McFaddin (to Union Oil Co. of Calif.). U. S. 2,185,311, Jan. 2. Various details of app. arrangement are described, and of a process for scpg. a solvent soln. of SO_2, benzene and water comprising vaporizing the soln., fractionating the vapors in contact with liquid SO_2 reflux substantially free from and at a temp. and pressure which will condense substantially all of the benzene vapors but will allow water vapor to remain uncondensed and producing thereby fractionated overhead vapors consisting of SO_2 and water substantially free from benzene.

Solvent refining of petroleum lubricant fractions. Douglas L. Hooker and Carl M. Fabian (to Socony-Vacuum Oil Co.). U. S. 2,184,838, Dec. 26. An arrangement of app. is described, and a method for double solvent refining of petroleum lubricant fractions which comprises causing a paraffinic solvent such as propane and a naphthenic solvent such as "selecto" to flow through a series of stages each consisting of a mixing step and a settling step, introducing an oil to be treated to a stage intermediate the ends of the series, removing paraffinic solvent and a raffinate oil from one end of the series, removing naphthenic solvent and an ext. oil from the other end of the series, and by-passing a portion of one solvent across at least one intermediate stage so that the throughput of solvent in that intermediate stage may be less than the total throughput, the throughput at the initial and end stages may be equal to the total throughput, and the relative concn. of solvent in the solvent-solute phase formed by the solvent at the point of reintroduction may be greater than in the absence of such by-passing.

Lubricant. Michael J. Galvin, assignee of one-fourth interest to Viola R. MacMillan. Can. 387,328, Mar. 5, 1940. MoS_2 in its natural state is ground to a semicolloidal condition and mixed with a lubricant thinner, e. g., graphite or Al. It prevents oxidation and friction of a metallic surface.

Dialkylhalobenzenoid sulfides. Jesse H. Babcock and Anthony Loverde (to Hooker Electrochemical Co.). U. S. 2,185,009, Dec. 26. Compds. which may be added to lubricating oils to improve their film strength, such as dichlorophenyl methyl polysulfide, dichloronaphthyl methyl polysulfide or dichloroanthracyl methyl polysulfide, are produced by a process typified by treating a halobenzenoid alkyl halide having at least one halogen atom and at least one halogenated alkyl group attached to the C ring with a compd. of an alkali metal with S having at least one S atom per mol. substantially free from hyposulfide and sulfate, in an aq. soln., and mechanically sepg. the product from the aq. medium contg. the by-product. Various examples with details of procedure are given.

Apparatus (with an immersion heater) suitable for heating and melting bituminous materials. Geo. P. Kittel. U. S. 2,185,594, Jan. 2. Various structural and operative details of an app. which may be heated by a directed flame burner.

Apparatus for testing the ductility of asphaltic, bituminous, and like materials. Charles S. Howe (to Industrial Developments Inc.). U. S. 2,185,340, Jan. 2. Various structural and operative details are described.

23—CELLULOSE AND PAPER

CARLETON B. CURRAN

The Sauter diagrams of natural cellulose. T. Kubo. *Naturwissenschaften* **27**, 857–8(1939).—Sauter (*C. A.* **31**, 3257[8]) found 4 addnl. interference points inside the usual diffraction interferences of natural cellulose, and Kiessig (*C. A.* **33**, 6585[9]) partly confirmed this. By use of a Cr anticathode a no. of successive equator diagrams were

made of natural cellulose (ramie); the Sauter lines did not show in the first diagram taken with polished, clean anticathode but gradually appeared with increasing intensity in later diagrams with the same anticathode. With Cu anticathode the Sauter lines did not appear. It is assumed that the Sauter lines are not due to cellulose structural effect but to lack of monochromatism of the x-rays. Comparison of the wave lengths calcd. from Sauter diagrams with $WL\alpha$ and $L\beta$ radiation and direct calcite spectrograms of the radiation used confirmed this view.
B. J. C. van der Hoeven

The trend of progress in the cellulose industry, with special reference to the paper and allied industries Julius Grant. *World's Paper Trade Rev.* 112, TS153–6, 161–5 (1939).—See *C. A.* **33**, 7094[9]. A. Papineau-Couture

Solubility of β-cellulose in aqueous solutions of inorganic and organic compounds. J. R. Katz and J. Seiberlich. *Paper Trade J.* 110, No. 7, 37-8(1940).—S-contg. 3 compds. affect the soly. to a greater extent than the corresponding O-contg. compds. The dissolving power of halogen compds. increases with the at. wt. of the halogen atom present. The dissolving power of a compd. increases with the no. of halogen atoms present. The dissolving power of org. lyotropic compds. is improved by increasing the length of the chain of the mol. The introduction of several hydrophobic groups into the mol. decreases the dissolving power of the compds.
A. Papineau-Couture

Fluidity of cotton in dimethyldibenzylammonium hydroxide—measure of cotton degradation. W. Walker Russell and Norman T. Woodberry. *Ind. Eng. Chem., Anal. Ed.* 12, 151-4(1940).—Different samples of bleached cotton cellulose (I) were found to dissolve readily in 0.5% concn. in the optimum dilf. 1.96 ± 0.01 *N* dimethyldibenzylammonium hydroxide (Triton F) (II) to produce 5 solns. whose fluidities (or viscosities) are a measure of the extent to which the I has been degraded. For the I studied the II fluidities are very nearly a tenth, and the II sp. viscosities very nearly twice the corresponding cuprammonium hydroxide values. The II method is simpler, as it can be carried out in the air and light, and is faster. Mark Plunguian

Vacuum filters for washing cellulose. A. S. Birillo. *Bumazhnaya Prom.* 1939, No. 1, 45–7; *Khim. Referat. Zhur.* 2, No. 5, 121-2(1939).—A no. of difficulties encountered during filtration and methods of overcoming them are described. In order to avoid loss of vacuum the temp. of the wash waters should not exceed 50–60°. To obtain alkalies of a max. d. a 2-fold or 3-fold washing in the same vacuum filter is recommended by sepg. the zones of washing into subzones (primary, secondary, tertiary). With the use of 2 vacuum filters it is possible to effect 6-fold washing and to reduce to a min. the amt. of weak alkalies which are used for the diln. of the stronger alkalies. This min. cannot be reached in the diffusers. W. R. H.

The modification of cellulose by oxidation. G. F. Davidson. *J. Soc. Dyers Colourists* 56, 58-63(1940).—A cellulosic material whose chem. and phys. properties have been modified by oxidation is here regarded as oxycellulose, and the insol. products of the hydrolytic action of acids on cellulose are regarded as hydrocelluloses. The work of investigators on these products is reviewed briefly. The recent investigations of the oxidation of cellulose by the methods of org. chemistry are of great importance and their extension to include other oxidants is desirable. In view of the diversity of the products obtained by the action of various oxidizing agents it appears certain that the oxidation of cellulose is, in general, a complicated process, but probably the primary oxidative attack on the cellulose chain-mol. is confined to a few simple reactions. Twenty-five references. W. H. Boynton

The mechanism of deformation and the fine structure of hydrated cellulose. XVI. The optical polarization analysis of the process of deformation of isotropic fibers of hydrated cellulose. 2. Double refraction in the swollen condition. P. H. Hermans and P. Platzek. *Z. physik. Chem.* A185, 269–305(1939); cf. *C. A.* **34**, 2586[9].—Swollen and progressively stretched fibers of hydrated cellulose, prepd. as previously described, were examd. with polarized 1 Na light. The results are interpreted on the basis of Wiener's (*C. A.* **6**, 950) double-refracting curves. Twenty-seven different liquids were used to swell the fibers by imbibition; the values obtained for the total double refraction of the treated fibers vary in a fairly systematic way with the n of the liquids. The total double refraction (G) is resolved into 2 components: (1) characteristic double refraction (E) due to an anisotropic arrangement of 2 the refracting particles and (2) double refraction due to stretching (S). The way in which these 3 quantities depend on the treatment of the fiber is considered in detail. E is not an invariant property of the material but increases with the tension. The sp. double refraction (G/d) for the air-dried and swollen (benzyl alcohol) conditions can be calcd. one from the other provided the degree of swelling does not exceed 2. The results make it necessary to 3 discard the idea that the fiber structure consists of cryst. rods which can orient themselves but which do not change their form. A structure which consists of long straight mols. which undergo a change in cross section when their long axes are oriented is consistent with the exptl. facts, as is also a structure made up of coiled mols. Analogies are drawn between the degree of swelling and the corresponding optical properties of hydrated cellulose and rubber. T. H. Dunkelberger

Esterification of cellulose and cellulose hydrate. V. I. Shettle, N. Klyuchkin and M. Fuks. *J. Applied Chem.* (U. S. S. R.) 12, 1143–6(in German, 1146)(1939); cf. *C. A.* **33**, 6587[7].—The degree of esterification of cellulose in the presence of pyridine by means of acid chlorides 4 in $CHCl_3$ soln. was lower than in C_6H_6 soln. The substitution of pyridine by quinoline lowered the degree of esterification. A. A. Podgorny

New processes for producing cellulose derivatives. R. Steinmann. *Kunststoffe* 29, 282–6(1939).—This review 5 cites 39 recent references. J. W. Perry

Preparation of cellulose derivatives with maintenance of their fibrous structure. IV. Cellulose nitroacetate. 3. I. Simoda and S. Kamihara. *Cellulose Ind.* (Tokyo) 15, 161-66, *Abstracts* (in German) 34-41(1939); cf. *C. A.* **33**, 7559[6].—The acetylation of cellulose nitrate was investigated, the ratio of HNO_3:H_2SO_4 being 1:1. Also the ef- 6 fects of adding urea to the nitrating bath, and treating the cellulose nitrate with MeOH before acetylation, were studied. Nitration was carried out at varying temp. and time, but with a pulp to acid ratio of 1:50; stabilization was effected by boiling with H_2O. Acetylation took place at 30°, with 25 cc. of a mixture of C_6H_6 (180 g.), Ac_2O (60 g.), and H_2SO_4 (d. 1.84, 1.5 g.) per 1 g. of the nitrate. The reduction in HNO_3 content reduced the η, but not below that of com. cellulose acetates. The intermediate MeOH treatment greatly accelerated the acetylation even in comparison with Ac_2O, used in previous expts. Raising the temp. of nitration from 0° to 20° also accelerated the reaction without affecting the η, but addn. of urea produced no apparent improvements. The formation of coagula in the acetate, however, was a disadvantage, and these could not be avoided, except by modifications to the method of acetylation which would seriously affect 8 the properties of the acetate. B. C. P. A.

Cellulose esters of dibasic organic acids. Carl J. Malm and Charles R. Fordyce. *Ind. Eng. Chem.* 32, 405-8 (1940).—Cellulose alkyl dicarboxylates, ROOCR'COOR", in which R is a residue of cellulose (I) or cellulose acetate (II) with 35% Ac, R' is C_2H_4 or C_6H_4, and R" is Me, Et or Bu, were prepd. according to the general method of Clarke and Malm (*C. A.* **27**, 600) by heating 100 g. cotton linters, 500 g. $(ClCH_2CO)_2O$, 2 g. $Mg(ClO_4)_2$, and slightly more 9 than the theoretical amt. of the succinic or phthalic half ester for 2–5 hrs. at 70° and pptg. and washing with MeOH. Tables give m. p. and qual. soly. in MeAc, EtAc, AcOEt, AcOBu, $MeCHCl_2$, PhH, PhMe and dioxane. As coating compns., they have good soly. and moisture resistance but tend to be brittle. The corresponding free acids were prepd. according to the patents of Malm and Waring (*C. A.* **31**, 8194[8]) and Schultze (*C. A.* **31**, 2430[4]) by heating 100 g. I, 400 g. phthalic anhy-

dride, and 500 g. pyridine 12 hrs. at 100°, then adding 400 cc. concd. HCl. These acids had very limited soly. but those made from II, particularly if contg. more than 15% phthalyl, were sol. in ketones, AcOEt, dioxane, dil. NaOH, $NaHCO_3$ and NH_4OH. The Ca, Co and Zn salts are also sol. in H_2O; but the Ba, Cu, Ag, Cd, Ni, Cr and Pb salts are insol. The sol. salts give viscous solns. in H_2O, showing the same form of viscosity-concn. curve as solns. of the acid in MeAc. They give clear, nonhygroscopic films on evapn. which do not become brittle at low humidity if softened by a H_2O-sol. plasticizer. Fibers made of II with a small amt. of these acids have much increased affinity for basic dyes. Arnold M. Collins

Cellulose formate. XI. Effects of the ratio of formic acid to cellulose material on qualities of ester produced. Y. Ueda, S. Nakamura and T. Simada. *Cellulose Ind.* (Tokyo) 15, 212–17, *Abstracts* (in English) 49–50(1939); cf. *C. A.* 33, 4419⁷.—The effect is investigated of varying the quantity of pulp to be formylated and the amount of HCO_2H (I), the ratio $I:H_2SO_4$ (40:3) being kept const. The optimum results as regards the I content and sp. η of the cellulose formate, and the tensile strength and elongation of fibers produced from C_5H_5N soln., were obtained by treating 4 g. of pulp at 25° for 16–30 hrs. in 40 g. of 98.5% I and 3 g. of H_2SO_4 (d. 1.84). B. C. P. A.

Cellulose sheet swelling—effect of temperature and concentration of sodium hydroxide solutions. Geo. A. Richter and Kenneth E. Glidden. *Ind. Eng. Chem.* 32, 480–6(1940).—Data are presented (graphs and tables) for 4 wood pulps (a coniferous and a hardwood sulfite, an alpha pulp of sulfite origin, and a bleached sulfate) and one cotton linter pulp of rayon type, showing their dimensional changes when submerged in NaOH solns. ranging from 6 to 30% at temps. from 5 to 35°. The process history markedly affects the differences in degree of swelling, as well as wt. increases. In all cases volumetric swelling and liquor absorption are max. at concns. of 10–12% NaOH and more pronounced at the lower temps. C. E. Curran

Hexylcellulose and ethylhexylcellulose. I. The synthesis of hexylcellulose. N. N. Iznairskaya, G. S. Rubinson and P. I. Kagan. *J. Applied Chem.* (U. S. S. R.) 12, 1050–5(in French, 1056)(1939).—Linter was mercerized with 50% NaOH soln., matured for 24 hrs. and then etherified with hexyl chloride (the ratio of cellulose to hexyl chloride 1:10 was optimal) in the autoclave under pressures up to 4 atm. at 125° for 16–24 hrs. with const. stirring. The vessel and stirrer were silver-plated. The ether was distd. under 5–10 mm. at 135–40°, then steam-distd., washed with water, and dried *in vacuo* at 50°. It contained C 62.15 and H 10.04%, it was sol. in the alc.-C_6H_6 (1:4) mixt. to the extent of 94.71% and its 3% soln. had a viscosity of 1.49 (Ostwald). Stepwise treatment of cellulose with hexyl chloride did not increase the percentage of substitution. The product was dihexylcellulose. **II. The synthesis of ethylhexylcellulose.** N. N. Iznairskaya and G. S. Rubinson. *Ibid.* 1057–9(in French, 1059).—Seven mols. of EtCl, 2–3 mols. of hexyl chloride and 1 mol. of cellulose were autoclaved in the presence of equimolar amts. of alkali. The product was purified as above. The ethylhexylcellulose was not sol. in water. The degree of substitution could not be detd. by the Zeisel method. A. A. Podgorny

Some lesser known nitrocellulose sols and their properties. A. de Waele. *J. Oil Colour Chem. Assoc.* 22, 57–65, 67–72(1939).—Different degrees of affinity between nitrocellulose (I) and various plasticizers become evident on examg. sols and gels formed therefrom. Plasticizers of the true solvent type overcome the attractive forces between the mols. of I and direct formation of a fluid sol is possible. With tritolyl phosphate (II), which has less affinity for I, a powerful solvent must be used to overcome the attractive forces between mols. of I. A sol can then be obtained by evapg. off such solvent from a soln. of I and II. Sols so obtained are only apparently homogeneous. Their true emulsoid character becomes more apparent when certain plasticizers are used which have still less affinity for I, e. g., castor oil, diglycol laurate. Sol-gel reversibility is attributed to a phase inversion, solid-in-liquid to liquid-in-solid. In general, the greater the affinity of a plasticizer is for I, (1) the smaller the proportion of acetone in the alc.-acetone solvent mixt. which just dissolves a film of I and 8 times that amt. of plasticizer and (2) the less the permeability of such films to benzene. Relationships between a plasticizer's chem. structure and its affinity for I are discussed, e. g., decrease in affinity caused by long alkyl chains and increased affinity due to carboxylic ester groups and increasing unsatn. in long alkyl chains as in linoleates. Cf. following abstr. J. W. P.

The gelation of nitrocellulose sols induced by antimony oxide. A. de Waele. *J. Oil Colour Chem. Assoc.* 22, 65–7, 67–72(1939); cf. preceding abstr.—Gelation of a sol of nitrocellulose (I), Sb oxide or TiO_2 and diglycol laurate (II) in BuOAc and alc. was attributed to reaction between the pigment and —COOH groups formed in I by oxidation. Such reaction causes tridimensional linkage between the emulsoid I particles. No gelation, but rather loss in viscosity, occurred in absence of II or on replacing the pigments mentioned by $BaSO_4$. J. W. P.

The chemical nature of Douglas fir lignin. E. B. Brookbank, Jr., and F. E. Brauns. *Paper Trade J.* 110, No. 5, 33–5(1940); cf. *C. A.* 33, 4024⁷.—Six lignin products were prepd. from Douglas fir heartwood and sapwood: H_2SO_4-lignin, Willstätter lignin, thioglycolic acid lignin, Et_2O-insol. PhOH-lignin A, Et_2O-insol. PhOH-lignin B and methylated Et_2O-insol. PhOH-lignin A. Their analyses were compared with those of similar compds. prepd. from sprucewood. The differences between the 3 types were so small that they make chem. differences in their compn., other than polymerization and isomerism, improbable. A. Papineau-Couture

Aspects of the viscose industry. G. S. Heaven. *Soc. Chem. Ind., Chem. Eng. Group, Proc.* 20, 112–15(1938).—The application of the viscose process to the production of cellulose films is considered in relation to the raw materials used and the effluents to be disposed of. B. C. P. A.

A method for the determination of the macroheterogeneous condition of viscose. Atanazy Boryniec. *Przemysl Chem.* 22, 278, 85(1938); *Atti X° congr. intern. chim.* 4, 707–18(1939).—Viscose solns. contain varying quantities of undissolved or jelled particles which, when present in larger quantities, cause breakages during spinning and in the production of films. It is important to check on the heterogeneous condition of the viscose spinning soln. A method is described for an estn. of the macroheterogeneity of viscose solns. It is based on the deformation of a viscose thread which is dropping into a paraffin oil bath. This deformation is proportionate to the macroheterogeneous condition of the viscose soln. and it is registered by a photoelec. recorder. The effects of various phys. and chem. conditions of the heterogeneity of viscose can be studied and recorded by this method. D. Jorysch

Pulp and staple rayon, a cellulose problem. Richard E. Dörr. *Angew. Chem.* 53, 13–17(1940).—A discussion covering raw materials and processing problems. Karl Kammermeyer

Correlation of forestry industries. H. O. Chute. *News Ed.* (*Am. Chem. Soc.*) 18, 256(1940). E. J. C.

Wood chemistry. XIII. Chemical composition of Korean rakuyosho (Larix dahurica, var. Coreana nakai). Y. Ueda and T. Nebu. *Cellulose Ind.* (Tokyo) 15, 211, *Abstracts* (in English) 48–9(1939); cf. *C. A.* 33, 6590⁸.—The wood contains lignin 25.1, total cellulose 45.2 (with 70.3% of α-cellulose), ash 0.13 and EtOH-C_6H_6 ext. 5.0%. Loss on drying is 9.14%. B. C. P. A.

Notes on the quality of groundwood. James D'A. Clark. *Paper Trade J.* 110, No. 9, 29–32(1940).—Visual and manual practical tests for the quality of groundwoods are described with a discussion of the interpretation of results obtained from instruments and sheet-making equipment. Data are given on the effect of beating on fairly fine groundwoods which, as far as quality improvement is concerned, appears to be negligible. Marked anomalies in the use of freeness testers for detg. slowness are noted and attributed to the escape of important fine material through the grid plate of the app.; for this reason the

value of the freeness reading for fine pulps or pulps contg. much fine material is questioned. Classification of pulps and blending tests are shown to be very valuable in addn. to common tests and in some cases indispensable for distinguishing between pulps of obviously widely different characteristics. A. Papineau-Couture

The wet strength of groundwood. K. C. Logan. *Pacific Pulp & Paper Ind.* 13, No. 12, 29-30(1939).—A simple and quick method, giving reproducible results, is described for detg. the wet strength of groundwood. It consists essentially in forming the pulp sample into a sheet according to any suitable method (e. g., T.A.P.P.I. method 205M), removing from the press without giving the 2nd pressing, and subjecting to a uniformly increasing pressure differential until it ruptures. A simple, compact app., requiring little care, for carrying out the test is described. A. Papineau-Couture

The sulfonation of western hemlock lignin. Arthur L. Mottet. *Pacific Pulp & Paper Ind.* 13, No. 10, 22-5 (1939).—The sulfonation reaction of lignin was studied by means of cation-exchange phenomena, with a slight modification of Kullgren's method (*C. A.* 26, 2315). The rate of sulfonation of western hemlock liguin with $NaHSO_3$ soln. (at const. temp. and time) varies with the $NaHSO_3$ concn.; about 15% greater sulfonation was obtained with 9.0% soln. than with 3.0%; at higher concns. small changes were not as effective in changing the sulfonation rate as changes at lower concns., which may be due to the fact that, at higher concns. increases in $NaHSO_3$ concn. are not accompanied by corresponding increases in "effective concns." of HSO_3 ions. NH_4HSO_3 produces significantly higher sulfonation than Na, Ca or Mg bisulfites, which explains the superior cooking action of NH_3-base sulfite cooking liquors. The lignins of Sitka spruce and of western hemlock exhibit substantially the same ease of sulfonation; Douglas fir lignin is much more difficult to sulfonate, the difference possibly originating in chem. differences in the lignins of these species. Max. rate of sulfonation develops when the cooking liquor contains somewhat less than 20% of combined SO_2 (of the total SO_2); the min. rate apparently falls somewhere between 80 and 100% combined SO_2. There is a straight-line relationship between sulfonation rate and temp., the reaction rate increasing only very slowly with increase in temp. (20% increase for a 30° rise in temp.). About one-half of the lignin seems to be sulfonated much more rapidly than the remainder; the difference may be due partly to the difference in accessibility of middle-lamella lignin and secondary wall lignin to the HSO_3 ions and partly to differences in the sulfonatable groups in the lignin. A. Papineau-Couture

Disintegration of larch wood from Honsyû by the sulfate cooking process. I. Y. Hukuda and M. Horio. *J. Soc. Chem. Ind., Japan* 42, Suppl. binding 367-9(1939) (in German).—Two samples of larch wood (500 g. of each), one from the lowlands and one from the mountainous regions of Nagano, were heated, resp., 5 hrs. in an autoclave (last 4 hrs. at 160°) with 2 l. of a soln. contg. 100 g. NaOH, 44 g. Na_2S, 40 g. Na_2CO_3, 6 g. $Na_2S_2O_3$ and 20 g. Na_2SO_4, the max. pressure being 6-7 kg./sq. cm. The yields of unbleached cellulose were 42.9 and 37.1%, resp., as compared with 36.6% for the first sample by the sulfite process. The crude cellulose was chlorinated, washed with alkali soln., then bleached twice with Ca hypochlorite soln. The yields were 94 and 93%, resp., as compared with 80% for the first sample, treated by the sulfite process but with omission of one of the Ca hypochlorite treatments. The yield and quality of the sulfate-cooked cellulose are much better than those of the sulfite-processed material. The sulfite cellulose is slightly bluish, while the sulfate cellulose is faintly yellow. George Ayers

Tropical woods for manufacture of pulp. IV. Composition of British North Borneo woods. I. Miura and S. Kitano. *Cellulose Ind.* (Tokyo) 15, 167-70, *Abstracts* (in English) 42-3(1939); cf. *C. A.* 33, 8402[7].—Thirteen British North Borneo woods were analyzed to det. their value as raw materials for papermaking. The woods are stated to compare favorably as regards their chem. consts. with Philippine and Dutch New Guinea woods. Of the North Borneo woods, taukawang had the highest total cellulose content (56.6%) and α-cellulose (on the total cellulose, 79%), and at the same time it was among the lowest as regards extractable matter in H_2O (1.6%), EtOH-C_6H_6 (1.6%) and 1% NaOH (8.0%). Majau gave the highest lignin content (34.8%) and balsa the lowest (22.9%). B. C. P. A.

Manchurian woods for manufacture of pulp. IV. Cooking of hardwoods. I. Miura and T. Nakatuka. *Cellulose Ind.* (Tokyo) 15, 218-20, *Abstracts* (in English) 50-2(1939); cf. *C. A.* 34, 1845[8].—Ten species were digested by the sulfite process and the chem. consts. of the bleached and unbleached pulps detd. An unusually low yield of bleached pulps was obtained, which is ascribed to unsuitable cooking conditions. The highest yield of unbleached and bleached pulps, however, was obtained with *Fraxinus mandshurica* (51.9% and 43.9%), while the lowest was with *Ulmus japonica* (34.3% and 22.5%). The α-cellulose (bleached) varied between 81.4% and 91.5%, and the EtOH-C_6H_6 exts. between 0.7% and 1.8%, while the η (about 1.5) and ash contents (about 0.5%) were fairly const. *Maackia amurensis*, Rupr. et Max., and *Phellodendron amurense*, Rupr., were not satisfactorily digested. B. C. P. A.

Chemical investigation of wood substances. XIII. Sulfite pulps from forest thinnings and their properties. K. Nisida, R. Miyama and J. Soezima. *Cellulose Ind.* (Tokyo) 15, 203-10, *Abstracts* (in German) 45-8(1939); cf. *C. A.* 33, 6590[5].—The following woods were cooked by the sulfite process and the chem. consts. of their bleached (two-stage) pulps detd.: *Cryptomeria japonica* [Masugi (I), Kurosinsugi (II)], *Chamoecyparis obtusa* (III), *Pinus densiflora* (IV), and *P. thunbergii* (V). The cooks were carried out with about 5-6% of total SO_2 and about 4-5% free SO_2. Thus I, IV and V gave bleached pulps suitable for viscose production, in 40.7, 39.8 and 40.5% yields, resp. II and III, however, with yields of 35.7% and 41.6%, resp., were comparatively less favorable for this purpose. B. C. P. A.

Infrared photomicrography reveals plant cell-wall structure. W. Frank Fowler, Jr., and Wm. M. Harlow. *Paper Ind. Paper World* 21, 1159-60(1940).—A method of prepg. photomicrographs of thin sections of chemically untreated eastern white pine wood is described, wherein neocyanine (an infrared-absorbing dye) is used to stain the section and infrared radiation and special infrared sensitive film are used. The resulting photomicrographs show clearly the structure of the "compd. middle lamella," resolving it into its component parts, the primary walls and the true intercellular substance. Previous observations on the primary wall made after chem. treatment of thin sections were confirmed. A. Papineau-Couture

Practical hints on mechanical pulping for newsprint. J. D. Brown. *Pulp Paper Mag. Can.* 41, 91-7, 103 (1940). A. Papineau-Couture

Report of the wood chemistry committee (of the Technical Section of the Canadian Pulp & Paper Association). Appendix A. Advances in the chemistry of wood 1938-1939. F. H. Yorston. *Pulp Paper Mag. Can.* 41, 144-8(1940).—A review with 54 references. **Appendix B. Recent advances in the utilization of lignin in waste sulfite liquor.** Allan C. Hill. *Ibid.* 148-50, 196.—A review of the general direction of recent advances, with comments on their probable contributions to a final solution of the sulfite waste liquor problem; with 33 references. A. P.-C.

The economic possibilities of using high-density wood. C. McMichael and R. J. McInnis. *Pulp Paper Mag. Can.* 41, 194-5(1940).—A discussion of the advantageous results which may be expected from the use of high-d. wood (0.400) as compared with low-d. (0.330) in the wood-handling departments, the grinder room, the sulfite mill and the paper mill. A. Papineau-Couture

Effect of grinding consistency and temperature using a miniature grinder. H. Andrews. *Pulp Paper Mag. Can.* 41, 87-90(1940).—At consistencies over 5% erratic results were secured, so no data are given with respect to the effect of consistency. With const. freeness of the pulp

produced, increasing grinding temp. from 132°F. to 172°F. resulted in a decrease in production, no change in power consumption, increase in Mullen test, slight increase in tear resistance and bulk, and a slight increase in "long" fiber fractions and slight decrease in "fines." A. Papineau-Couture 1

Forced digester circulation and chip packing. L. C. Kelley. *Pulp Paper Mag. Can.* **41**, 113–16, 122(1940).—From a general discussion of the problem it is concluded that chip packing without forced circulation results in an increase in screenings, and that the combination of packing with a steam packer and forced circulation with indirect heating and hot acid seems to be about the ideal combination. A. Papineau-Couture 2

The effect of chipping on the suitability of wood for sulfite pulping. H. Green and F. H. Yorston. *Pulp Paper Mag. Can.* **41**, 123–6(1940).—Chips prepd. in several sulfite pulp mills were found to contain 10–15% of wood which had been subjected to high compressive stress. The situation of the damaged wood in the chip showed that the greater part of the damage had taken place during chipping. Presence of stressed wood in the chips does not affect the yield or the bleachability of the pulp, but causes appreciable loss of strength. A. Papineau-Couture 3

Effect of acid concentration and temperature schedule in pulping resinous woods. G. H. Chidester and J. N. McGovern. *Paper Trade J.* **110**, No. 10, 39–42(1940).—Increasing the SO_2 concn. and using lower temps. together with a longer cooking time have a beneficial effect in pulping jack pine, Douglas fir and southern pine. By using suitable conditions the quantity of screenings obtained from the heartwood of the various samples could be reduced to a value sufficiently low to indicate a satisfactory degree of pulping for the whole wood contg. ordinary quantities of heartwood. Some improvement was shown in the color, strength, and in the amt. of screenings produced by the sapwood when cooked in the presence of heartwood, but the effects were much less pronounced than in the case of heartwood. The results are believed to be generally applicable to representative samples of jack pine pulpwood. Douglas fir up to 100 yrs. old and contg. up to 78% heartwood was reduced to a satisfactory degree; but it is possible that wood of extreme age would require further modification for complete reduction. The results on southern pine were obtained on only one thoroughly seasoned sample and are considered only as indicative of a trend. A. Papineau-Couture 4 5

The practical application of the classification of groundwood pulp. Bruno A. Koskinen. *Pulp Paper Mag. Can.* **41**, 132–8(1940).—A method of detg. groundwood quality and expressing it in numerical terms is described. It consists in a classification test carried out by means of a modification of the Abitibi classifier (cf. Campbell, *C. A.* **24**, 5489). The results are empirical, and the actual details of test conditions must be worked out to suit the conditions of the individual mill where it is to be used. Curves prepd. from operating records over a period of 2 yrs. at the Manitoba Paper Co.'s Pine Falls mill are presented and discussed, showing the relation between groundwood quality and the strength and porosity of a sheet of newsprint. A. Papineau-Couture 6 7

Pulping bagasse by chlorination method. Lilly Gomez and Geminiano O. Aguila. *Univ. Philippines Nat. and Applied Sci. Bull.* **7**, 227–31(1939).—Lab. pulping expts. with bagasse from several sources, in which Cl gas and a dil. NaOH soln. followed by NaOCl bleaching are used, gave a 37% yield of pulp with an α-cellulose content too low (approx. 76.5%) for satisfactory use for rayon production. Complete analyses of the chem. compn. of the bagasse and resulting pulp are given. C. E. Curran 8

Sulfite hardwood pulps and their applications. M. O. Schur and W. L. Hearn. *Paper Mill* **62**, No. 38, 18–19 (1939).—The characteristics of hardwood sulfites made by Brown Co. are tabulated and compared with those of soda pulps and softwood sulfites. The uses for hardwood sulfites are briefly indicated. A. P.-C. 9

The effect of white-water loss in the testing of mechanical pulp. W. S. Morris and R. De Montigny. *Pulp Paper Mag. Can.* **41**, 107–12(1940).—Tests were made on 84 groundwood pulps with handsheets made by the standard procedure established by the Brit. pulp evaluation committee, and also by a modified method which eliminates loss of fine material. With the exception of drainage time, differences were not large enough to affect routine testing in mill operation and correlation of properties was not improved; the species of wood yielding low-strength pulps of high freeness assocd. with high percentage of fine material showed the largest differences. With respect to testing for research purposes, the modified method does not seem to offer any marked advantage other than slightly better accuracy. A. Papineau-Couture 10

Better pulp with rubber. H. H. Burrows. *Paper Mill* **62**, No. 42, 49(1939).—A brief discussion of the use of rubber linings in the pulp and paper industry and of their merits. A. Papineau-Couture 11

Investigation of damages caused by fungi in wet mechanical wood pulp. E. Rennerfelt. *World's Paper Trade Rev.* **112**, TS169–75(1939); **113**, TS1–3(1940); cf. *C. A.* **33**, 3148[3].—The chief sources of fungal infection of groundwood are: (1) the wood, (2) the fresh water, (3) the mill air, (4) the white water. Source (1) can be discarded as such high temp. is developed at the grinding that both mycelium and spores are killed and the newly ground pulp is practically sterile. In most mills (3) contributes only a very small part of the infection, generally not more than about 0.1%. The proportion of infection due to (2) varies from about 10% in mills with an open water system, to about 0.5–2% in mills with a closed water system; the remainder of the infection comes from (4). The most important factor influencing the growth and compn. of the microflora is apparently the temp. of the system and the assocd. degree of closeness of the system. Possible methods of control are discussed. Best results have so far been obtained with Lignasan and Pulpasan, prepns. contg. about 6% ethyl mercury chloride; in lab. tests the pulp was protected by using an amt. equiv. to 25–50 g. per t. of wet pulp (costing 2–4 d. per ton), but in practice it is necessary to add more of the chemicals (about 200 g. per ton) to keep the pulp in good condition during several months' storage. A. Papineau-Couture 12

Some economic aspects of the use of sawmill "waste" for chemical pulp in Quebec and the Maritime Provinces. J. B. Prince and E. S. Fellows. *Pulp Paper Mag. Can.* **41**, 185–90(1940).—The quantity available at the present time amounts to over 400,000 cords annually. The full advantages of a plan for chipping and pulping this material cannot be realized unless the scheme is dealt with on a large scale. A. Papineau-Couture 13

Pulps. XIV. Sulfite cooking of larch from Honsyu. 2. Y. Hukuda. *Cellulose Ind.* (Tokyo) **15**, 154–7, *Abstracts* (in German) 29–32(1939).—Since previous expts. indicate that Honsyu larch (*Larix kaempferi*, Sarg.) was difficult to digest, because of the resistance of the heartwood, exptl. cooks with the heartwood and sapwood sepd. were undertaken. The results showed that although the two woods were similar in compn. initially, the pulps produced from them under the same conditions varied considerably. Thus the sapwood and heartwood pulps, resp., contained 1.3 (13.6)% of lignin and 95.7 (82.9)% of α-cellulose. To obtain uniform digestion, therefore, the cooking schedule should be so designed as to obtain complete liberation of the heartwood. The changes in the chem. consts. of the mixed pulp after applying three-stage bleaching methods are tabulated. **XV. Analysis of red pine.** M. Kinoto. *Ibid.* 158–60, *Abstracts* (in German) 32–3.—The chem. consts. of pinewood from three different inland districts of Japan are tabulated. In each case the trees were sampled at the upper and lower extremities and in the middle of the trunk. Thus the α-cellulose varied from 51 to 57%, the lignin from 26.9 to 30.8%, and the EtOH-C_6H_6 ext. from about 3.0 to 11.8%. The ext. values varied considerably within each tree. B. C. P. A. 14

Sulfite liquor developments. Guy C. Howard. *Chem. & Met. Eng.* **46**, 618–19(1939).—A method of recovering Ca sulfite and a Ca salt of lignisulfonic acid from waste

sulfite liquor has been accomplished by means of a three-stage lime pptn. treatment. The inorg. salt is returned for use in making fresh cooking acid. The org. salt can serve as boiler fuel or be processed into vanillin, plastics, tanning reagents, etc. Tests on waste effluent show a reduction of 80% in the B. O. D. over the untreated liquor; this reduces materially the stream-pollution problem.
R. M. Boarts

Regeneration of sulfur dioxide and heat in cooking sulfite cellulose. S. A. Fotiev. *Bumazhnaya Prom.* 1939, No. 1, 8–14; *Khim. Referat. Zhur.* 2, No. 5, 122(1939).—Different systems for the regeneration of SO_2 and of heat are described. The method of Rosenblad (*C. A.* **32**, 8135[4]) gives best results. W. R. Henn

Sulfite liquor. III. Sulfonated lignin from waste liquor as an emulsifying agent. Leo Friedman and Carl L. Lindekin. *Pacific Pulp & Paper Ind.* 14, No. 1, 27–9 (1940); cf. *C. A.* **33**, 9632[3].—C_6H_6-water and kerosene-water emulsions were prepd. by using lignin sulfonate from *sulfite waste liquor* as the emulsifying agent. Less than 0.5% by wt. was sufficient to make good stable emulsions. The effects of phase-vol. relationship, of intermittent agitation, and of pH on emulsification in these systems were studied. A. Papineau-Couture

Industrial uses of waste liquor from sulfite pulp mills. A. J. Bailey. *Pacific Pulp & Paper Ind.* 13, No. 11, 34–5 (1939).—A description of the recovery of valuable by-products from sulfite waste liquor at the plant of Marathon Paper Mills Co., Rothschild, Wis. A. P.-C.

The recovery of heat in sulfite mill operation. H. Mason. *Pulp Paper Mag. Can.* **41**, 127–31(1940).—A brief discussion of the possibilities of reduction of various heat losses in sulfite operations, from which it is concluded that the av. sulfite mill might reduce steam costs and heat waste by about 50% by attaining the efficiency of recovery, in all respects, that certain mills do attain with respect to one or more of the controlling factors. A. P.-C.

Testing sulfite acid for combined. C. H. Nystrom. *Paper Ind. Paper World* 21, 1266(1940).—A brief discussion of the relative reliability (or otherwise) of different methods, from which it is concluded that Sander's I-KIO_3 method is the most accurate and satisfactory for mill control purposes. The method is as follows: titrate 2 cc. of sulfite acid with $^1/_{16}$ *N* I, using starch indicator (*A* cc.); add 20 cc. or an excess of 3% KIO_3 soln. and titrate fairly slowly with const. stirring with $^1/_{16}$ *N* $Na_2S_2O_3$ (*B* cc.); 0.1 *A* = percentage total SO_2; 0.1 *B* = percentage free SO_2; percentage combined SO_2 = total − free.
A. Papineau-Couture

The Pusey and Jones stream-flow vat. Philip H. Goldsmith. *Paper Mill* **62**, No. 42, 62, 65(1939).—A brief description of the vat and discussion of its merits.
A. Papineau-Couture

A new step in mill control. Arthur B. Green. *Paper Mill* **63**, No. 6, 14, 24(1940).—A device is described which indicates and records freeness of the stock leaving the jordans, the detn. being effected automatically at 5-min. intervals. A. Papineau-Couture

Metallurgical control and Fourdrinier wires. D. C. Dilley. *Paper Mill* **63**, No. 8, 140–6; No. 9, 16–18 (1940).—Methods used for the metallurgical control of the metal wires used in the manuf. of Fourdrinier wires for paper machines are described and illustrated by means of examples. Also in *Metals & Alloys*, **11**, 50–5, 77–81(1940).
A. Papineau-Couture

The reduction of sulfite in newsprint. D. D. Carr-Harris. *Pulp Paper Mag. Can.* **41**, 75–8(1940).—Over the range of 12–18% of sulfite there is very little change in the strength of sulfite-groundwood mixts., the observed variation being not much greater than the ordinary variation in groundwood properties experienced in many newsprint mills; it would, therefore, appear that addn. of sulfite to a sheet of newsprint effects some other change in the furnish and one which is highly important. Increasing fiber length by addn. of long groundwood fibers greatly increases bulkiness and freeness and slightly increases tear and fold; the effect becomes less marked as the change in fiber length becomes neg. with addn. of the finer fractions of groundwood. From a study of the relation between bulk and freeness of groundwood produced from different wood species, and of drainage factor *vs.* bulk for different wood species, it is deduced that grinding the wood to produce a stock of high surface area, i. e., of low bulk and drainage factor (fast-draining) might help to make possible the production of a newsprint sheet with lower sulfite content in the furnish. This theory can account for: (1) the increased strength of pulp brought on by addn. of flour material or white water which though possessing no strength itself does add to strength when used in small quantities; (2) the fact that a sulfite sheet on a filter appears drier than a groundwood sheet at the same moisture content. A. Papineau-Couture

The use of vortraps in pulp and paper mills. Fred B. Schilling. *Paper Mill* **62**, No. 38, 20–1(1939).—A brief description of the device and discussion of its merits.
A. Papineau-Couture

Pulp brightness in papermaking. G. A. Day. *Paper Mill* **62**, No. 41, 14, 19–20(1939).—Pulp brightness as a fixed value is a delusion. What actually is detd. is the brightness of a sheet of paper made from a given pulp alone, and the results depend on the exact conditions under which the sheet was prepd. Factors affecting the absorption coeff. *K* and the scattering coeff. *S* (of the Kubelka-Munk formula) are discussed. It is concluded that the most consistent values are obtained by observing the following points, which are believed valid on the basis of practical expts. and also from theory: the sheet should be heavy, of uniform formation; distd. water should be used; pressing should be light; the sample sheet should be completely air-dried at room temp., with the surface protected.
A. Papineau-Couture

Twenty-five years of the Technical Section (of the Canadian Pulp and Paper Association). J. N. Stephenson. *Pulp Paper Mag. Can.* **41**, 71–4(1940).—Historical.

Standards in their relation to production control. Sanford E. Thompson. *Paper Trade J.* 109, No. 21, 31–5 (1939).—A discussion of the utilization of standards of different types in paper and pulp manuf. and their relation to production control, with illustrations of the effect on quality and cost of the paper. A. Papineau-Couture

Pulp and paper mill utilization of hardwoods and other "little used" species. K. D. Running. *Pulp Paper Mag. Can.* **41**, 181–4, 190(1940).—A discussion of the possibilities, both economic and technological, of utilizing birch, maple, aspen, jack pine, white pine, beech and tamarack in Canadian pulp and paper mills, together with recommendations for future study. A. P.-C.

Advanced stock preparation-cyclifining. Joe Baxter, Jr. *Pacific Pulp & Paper Ind.* 14, No. 1, 16–20(1940); cf. *C. A.* **33**, 7099[9].—A general discussion of its merits.
A. Papineau-Couture

Some hints on crepe raw paper production. H. G. Wiener. *World's Paper Trade Rev.* 112, TS165–6(1939). —Brief practical operating hints. A. P.-C.

Flocculation of papermaking fibers. Friedrich Göbelhoff. *Zellstoff u. Papier* 20, 31–6(1940).—A brief theoretical discussion of fiber flocculation is given, and a method for detg. the flocculation point is described. Alum alone had but little effect on the flocculation of sulfite fibers in distd. H_2O. The addn. of bentonite, Karaya gum or a wetting agent caused increased flocculation. An increase in temp. also caused flocculation. Thicker and longer fibers flocculate more readily. S. I. Aronovsky

Retention of aluminum ion and hydrogen ion in papers. Herbert F. Launer. *Paper Trade J.* 110, No. 10, 29–34 (1940).—See *C. A.* **34**, 1848[8]. A. Papineau-Couture

Retention of fillers. S. W. Martin and W. R. Willets. *Paper Trade J.* 110, No. 8, 111–17(1940); cf. *C. A.* **29**, 7651[7].—In a system where only filler and fiber are present,

there can be no colloidal attraction, because both constituents are negatively charged; in such cases retention is a simple mech. filtration and will be governed by the wt. of the fiber mat, size of the interstices, etc. Alum has a great effect in improving retention because of its hydrolysis to positively charged Al_2O_3 which is adsorbed on the negatively charged fibers and acts as an electrostatic cement for the filler. The addn. of H_2SO_4 lowers the amt. of Al_2O_3 adsorbed by reversing the reaction to sol. $Al_2(SO_4)_3$; in spite of the fact that this $Al_2(SO_4)_3$ can ionize and thereby exert its flocculating action, retention is impaired to the point of mech. filtration. Flocculating effects cannot be discounted completely as the addn. of $MgSO_4$ increases the retention of filler somewhat. Rosin, which is known to have a definite particle size and to be a negatively charged colloid, has little effect on the retention of fillers; apparently alum acts on rosin in much the same manner as it does on filler. Addn. of alkali (as Na_2CO_3) decreases retention, probably because the electropos. nature of the Al_2O_3 is affected by an adsorption of OH ions. Addn. of Na aluminate increases the amt. of Al_2O_3 retained by the sheet but does not aid retention; this leads to the observation that Al_2O_3 produced by the action of Na aluminate on alum does not have the same electropos. characteristics as that produced by the hydration of alum alone. Synthetic Al_2O_3 is fairly well retained in the sheet but does not give rise to improved retention. Apparently there are 2 types of Al_2O_3: (1) an electropos. type resulting from the hydrolysis of alum with a high adsorption capacity for the fiber; (2) a type with different colloidal properties, which is retained mechanically by the fibrous network and has little or no effect on retention primarily because of the nature of its interface. Starch, being a neg. colloid and not being adsorbed to any great extent by paper fibers, does not have a beneficial effect on retention; there may even exist between the starch and the fiber a competitive selectivity for Al_2O_3, which acts as an inhibitor for the cementation of the filler on the fiber. The effect of more dil. stock and higher temps. in increasing retention can be explained on the basis of colloidal phenomena. The hydration of stock with its increase of fiber surface is shown to have a colloidal effect as well as a mech. effect. 1

A Papineau-Couture

Recent developments on papermaking cylinder vat construction. J. W. Joslyn. *Paper Trade J.* **110**, No. 7, 14–15(1940).—Attention is briefly drawn to a no. of devices recently developed by Sandy Hill Iron and Brass Works, Hudson Falls, N. Y.; Bertrams flow distributor, adjustable flow vat, combination slice and making board. 6

A. Papineau-Couture

Paper-machine wires. Harry G. Specht. *Pacific Pulp & Paper Ind.* **13**, No. 12, 17–19(1939).—A discussion of factors affecting wire life, sheet formation, drainage, printability, ink absorption and "show through." 7

A. Papineau-Couture

Some aspects of white-water flocculation. Edward N. Poor. *Paper Trade J.* **110**, No. 10, 37–8(1940).—A discussion of the flocculation of white water contg. highly filled solids, with a comparison of the action of various chem. treating agents. It is shown that the formation of gelatinous compds. promoting flocculation is not essential, and it is claimed that the efficiency of flocculating agents is to a great extent dependent on rates of ionization. Surface tension has a great influence on the efficiency of flocculation and flotation, in gelatinous media. A. P.-C. 8

Slime control at the Ontario Paper Co., Ltd. J. M. Forrester and E. G. Kirby. *Pulp Paper Mag. Can.* **41**, 83–6(1940).—A description of the method of slime control by means of chloramine in use at the Thorold, Ont., pulp and newsprint mill of the Ontario Paper Co., discussing its merits and the savings which were actually obtained. 9

A. Papineau-Couture

Instrumentation studies. XXXV. The Clark paper softness tester, with an important note on the Gurley stiffness tester. Staff of the Institute of Paper Chemistry. *Paper Trade J.* **110**, No. 7, 29–37(1940); cf. *C. A.* **34**, 2598⁸.—The overhanging length of the paper strip inserted in the roller mechanism of the Clark paper softness tester bears a straight-line relationship to the angle of rotation necessary to cause the strip to fall over. The correlation between Clark rigidity and Gurley stiffness is poor for limp papers, but somewhat better for stiff papers; one of the principal reasons for this poor correlation was found in a large source of error in the Gurley method, wherein errors range up to about 90% of the apparent Gurley stiffness. Clark rigidity correlates well with flexural rigidity as detd. by a research method involving a torsion pendulum. Subjective tests for softness of facial tissue, towel tissue, waxing glassine and bread wrappers correlate with the mean of the machine direction and the cross direction Clark softness values. The accuracy of detns. carried out on the Clark paper softness tester depends largely on the nature of the paper tested; for heavy uniform papers 5 detns. in each direction are sufficent but at least 10 representative strips in each direction are necessary for light-weight papers. A. Papineau-Couture 2 3

The effect of water hardness on the formation of floc from sodium aluminate. Lewis B. Miller and Ralph L. Lanz. *Paper Trade J.* **110**, No. 8, 131–3(1940).—A preliminary exptl. investigation showed that, where the water hardness is due primarily to Ca salts, the effect on floc formation from Na aluminate is small at a pH of about 9 to 11. Hardness due to Mg salts, on the contrary, has a very pronounced effect on the character of and conditions for floc formation. It is indicated that under certain conditions the addn. of Mg salts to Na aluminate in soft waters may be used to advantage in paper manuf. 4

A. Papineau-Couture

Promoting satisfactory bacteriological conditions in the paper mill. Robert F. Huntley and R. Hamilton Torrey. *Paper Trade J.* **110**, No. 8, 108–10(1940).—An outline of methods and controls which have been found by certain mills to enable them to produce a paper with a low bacterial count which is satisfactory to the public health authorities for use in milk containers. A. P.-C. 5

The background of sizing troubles. C. C. Irving. *Paper Mill* **62**, No. 45, 18–21(1939).—A brief discussion touching in turn on gum and wood rosin, size prepn., diln., methods of use, formation, and pressing and drying.

A. Papineau-Couture

Sizing. O. F. Hutchinson and P. M. Loddengaard. *Paper Mill* **62**, No. 50, 14–22(1939).—A brief description of Bewoid size and its method of manuf. together with a discussion of its merits and data on its performance.

A. Papineau-Couture

The practical properties of paper for spinning. Walter Frenzel. *Zellstoff u. Papier* **20**, 38–42(1940).—Paper for yarn or twine must have high water absorption, and high wet and tensile strength. While soda pulp is more suitable than sulfite for spinning paper, the sulfite pulp is mainly used for this purpose. The various phys. properties (tear resistance, tearing length, stretch, water absorption and sizing) of com. spinning papers are given.

S. I. Aronovsky

An evaluation of calcium carbonate coating colors formulated with various adhesives. Howard F. Roderick and A. E. Hughes. *Paper Trade J.* **110**, No. 8, 104–8 (1940).—Various adhesives suitable for use in the prep. of coated papers (casein, soybean protein, a no. of the starches) are described. Their evaluation is based on the properties they impart to finished coated papers. Each adhesive was incorporated in varying amts. in coating colors carrying 100% $CaCO_3$ as pigment and also in required amts. for a Dennison wax test of 4 to 5 with blends of $CaCO_3$ and clay. The evaluations given are taken from the calendered sheets and the effect of each adhesive on the various characteristics of the finished paper is presented graphically. A. Papineau-Couture

Drier waste heat recovery. R. J. Chambers. *Pulp Paper Mag. Can.* **41**, 104–6, 112(1940).—Decreasing mill system temps. in winter have an adverse effect on mill operation. In many mills drier waste heat could raise shower water temp. sufficiently to avoid some of this disturbance. Data are given showing the performance of three mill installations of towers and water sprays added to Brisar economizers; one mill shows appreciable im-

provements in steam consumption and sheet quality as a result of using this hot water. A. Papineau-Couture

Prevention of oxidation and rancidity in paper with oat flour. Sidney Musher. *Paper Trade J.* **110**, No. 8, 117–20(1940).—A description and discussion of the application of oat flour as a surface sizing to paper or board to prevent oxidation and rancidity of foodstuffs wrapped or packaged therein. A. Papineau-Couture

Laboratory evaluation of paper-coating raw materials. C. G. Landes. *Paper Trade J.* **110**, No. 11, 38-46(1940). —A detailed description of lab. procedures for mixing coating colors and prepg. and testing coated paper, illustrated by several examples of how the data obtained may be useful in evaluating raw materials and in formulating new coatings; together with suggestions as to improvements needed in the lab. procedures described. A. Papineau-Couture

Opaque papers. Wm. R. Willets. *Paper Ind. Paper World* **21**, 1261-3(1940).—A discussion of the use of TiO_2 for opacifying and brightening paper. A. P.-C.

Paper quality in relation to printing. R. H. Simmons. *Paper Trade J.* **109**, No. 21, 37-8(1939).—An outline of the tests used to evaluate the printing quality of papers prior to actual press work, enumerating the instruments and the significance of the results obtained in predicting probable defects. A. Papineau-Couture

The measurability of printing quality [of paper]. Warren Beazley. *Pulp Paper Mag. Can.* **41**, 117-22(1940).—A theoretical discussion dealing with the effect of smoothness (presenting several objections to present-day methods of measuring smoothness), oil-absorbency and wettability to oil. A. Papineau-Couture

The printability of newsprint. C. Bendtsen. *Pulp Paper Mag. Can.* **41**, 20–6, 43, 232 4(1940).—A simple method is described for showing the degree of sizing of newsprint and its tendency for giving strike-through. It consists essentially in detg. the water or brine absorption of the paper under very exactly defined conditions. The results are easily reproducible. Brine absorption gives a lower absorption figure than water for poor papers, and a higher figure than water absorption with good papers. The method is fairly reliable as regards the extreme points, but somewhat unreliable for medium qualities of paper. Four new paper-testing instruments are described and discussed. A smoothness (or more properly a roughness) tester differs from the Bekk smoothness tester in that it measures the passing of air under a narrow edge allowing the air to pass down into the recesses on the one side, under the edge and then up on the other side. The principle of measuring the velocity of the air current has also been used for the construction of a porosity tester, which is an auxiliary to the roughness tester, which operates at const. air pressure and which shows the result instantaneously. A spherical opacimeter has been designed to measure the transparency of paper. A substance-variation tester, by means of which the basis wt. variations in a paper strip can be tested in a few min., is based on the fact that variations of moisture and degree of compression do not essentially affect the opacity of the paper which, broadly speaking, depends only on the varying contents of dry substance and the compn. of the furnish. A paper strip is automatically passed between a const. source of light and a photoelec. cell; by means of an electron tube amplifier the elec. impulses from the cell are amplified sufficiently to operate a recording device which makes a transparency curve, which may be expressed in such units as to give directly the basis wt. A. Papineau-Couture

Waste into production in newsprint operation. F. A. Soy. *Pulp Paper Mag. Can.* **41**, 79-82(1940).—A review of what has been accomplished from 1931 to 1939 in the mills of Price Bros. & Co. by way of making a max. amt. of paper from a given unit of wood (the saving resulting from lowering the sulfite content of the paper is disregarded). The percentage total loss was reduced from 8.3 in 1931 to 6.0 in 1935 and to 1.1 in 1939. A. Papineau-Couture

How the properties of adhesives are related to the properties of paper surfaces. F. Camps-Campins. *Paper Trade J.* **110**, No. 8, 120-2(1940).—The comparative pore structures for a few papers are evaluated from their air-content values. The penetrating properties of the adhesives have to counterbalance the pore size of the paper; papers with small pores require penetrating types of adhesive, while papers with large pores need filming types. Further, pore size affects the rate at which adhesives set, and also the behavior of wet glue films under pressure. The properties of the adhesive must compensate for these factors and for unequal porosities in the surfaces to be adhered. A. Papineau-Couture

A new arrangement for measuring the stiffness of paper and cartons. Julius Bekk. *Zellstoff u. Papier* **20**, 6–8 (1940).—The ends of the paper sample are held in a double holder, fixed over one pan of a balance, so that the suspended paper forms a semicircle below the holder. The wt. required to be placed on the other pan sufficient to flatten and raise the paper to a predetd. point is taken as a measure of the stiffness of the sample. A no. of different types of paper and board were tested in this manner at relative humidities of 40, 65 and 90%. The stiffness of all papers decreased with increase in relative humidity, but the actual loss in stiffness differed for the various papers. The decrease in stiffness of the paper in the machine direction was considerably greater than in the cross direction. This difference varied somewhat with the sheet wt. A comparison between stiffness and tear resistance showed good agreement for some of the papers. S. I. Aronovsky

Bending tests of corrugated board and their significance. T. A. Carlson. *Paper Trade J.* **110**, No. 8, 123-7(1940). —The stiffness of corrugated fiberboard depends not only on the stiffness of the liners but also on the shear rigidity of the corrugated sheet. In bending tests with flutes perpendicular to the span the amt. of shear deformation has an important influence on stiffness. In spans of 5 in. or less the amt. of deflection due to shear in A-flute boards with 0.016-in. liners can be as great as or greater than the deflection due to tension and compression. With flutes parallel to the span, the shear deformation is considerably less and in spans greater than 10 in. may for practical purposes be neglected. The amt. of overhang used in bending tests also affects the stiffness; it is believed that an overhang of 0.5 in. would generally be within practical limits for moderate to long spans; bearing plates at supports and under the loading block are suggested to minimize local bending and crushing. A. Papineau-Couture

Kunstseiden- und Zellwolle-Taschenbuch. Ein praktisches Nachschlagewerk für alle Zweige der Kunstseide und Zellwolle herstellenden und verarbeitenden Industrien unter besonderer Berücksichtigung der Chemo-Technik auf den Gebieten der Veredlung und Verarbeitung. 7th ed. Berlin: Finanzverlag. 597 pp. M. 15.

Cellulose. Thomas Dillon, Donal T. Flood, Vincent C. Barry and Pádraig O'Muineacáin. Brit. 508,671, July 4, 1939. Divided on 508,715 (*C. A.* **34**, 2544[1]). Pulp for making wallboard, papier maché or paper is obtained by digesting seaweed with an aq. soln. of acid, e. g., H_2SO_4, sepg. the liquor, disintegrating the residual weed and mixing it with straw pulp, wood pulp or other fibrous material and then subjecting the mixt. to an alk. treatment that consists of heating in an aq. suspension with milk of lime to form insol. Ca derivs. that act as binding agents, and also to liberate amines, or consists of heating with an alkali such as soda whereby sol. alkali derivs. are

formed that may be pptd. in the fibers to act as binders by the addn. of acid or a sol. Al salt, e. g., $Al_2(SO_4)_3$. If desired, the weed may be fermented or retted before the digestion with acid.

Purified wood cellulose suitable for making cellulose derivatives. Lyle M. Sheldon, Lionel E. Goff, Milton L. Herzog and Fredrich Olsen (to Cellulose Research Corp.). U. S. 2,185,776, Jan. 2. A process of producing a purified wood cellulose having a viscosity above a predetd. min. comprises providing sulfite pulp having a viscosity above 20 centipoises as defined, subjecting the pulp to purification treatments, comprising chlorinating with an amount of Cl equiv. to 14-18% of the bleach value of the pulp and continuing the treatment at least until exhaustion of the Cl, treating the chlorinated pulp in dil. NaOH soln. at elevated temp. until the chlorinated compds. are dissolved, decolorizing and further purifying the pulp by treating in a hypochlorite soln. of not more than 3% concn. at a temp. in the range of 20–35° at a pH not less than 8.0 for not more than 4 hrs., boiling in a non-mercerizing caustic soda soln. and mercerizing the pulp so that the pulp has a cuprammonium viscosity of not less than 15 centipoises as defined, an α-cellulose content of not less than 98% and a soda soly. of not more than 3% detd. by boiling for about 3 hrs. in a 7.14 % NaOH soln. Cf. *C. A.* **34**, 1849[3].

Introducing nonacidic nitrogen into cellulose and its derivatives such as cellulose acetate. Henry Dreyfus. U. S. 2,186,101, Jan. 9. Cellulose or a cellulose deriv. is caused to react with NH_3 or an org. N-contg. compd. such as methylamine or diethylamine in the presence of a metal or metal compd. as a catalyst, such as Ni, Fe, Cu, or a sulfate of Mn or Cu. Several examples with details are given.

Coated cellulose hydrate sheets and films. British Cellophane Ltd. Brit. 508,822, July 6, 1939. An anchoring layer is provided between a cellulose hydrate sheet or film, which usually contains glycerol, glycol or like softener, and a hydrophobic coating, e. g., of a moistureproofing lacquer compn. or of a permanent adhesive or H_2O-resistant glue, the layer consisting of a polymerization product or products formed by the mixed polymerization of polymerizable compds. that contain an olefinic double bond with an ethylene α,β-dicarboxylic acid or with the anhydride or substitution product or other deriv. of such an acid. The product(s) may be formed by mixed polymerization of a vinyl ether with maleic anhydride (I). Thus, a cellulose hydrate film is coated with a soln. of the condensation product of I and vinyl methyl ether in AcOMe and cyclohexanone (II), excess soln. being squeezed off, the film dried at 80–100° and the thus pretreated film coated with a nitrocellulose lacquer. In another example, a condensation product of I and vinyl octadecyl ether in C_6H_6, AcOBu and II is used for the pretreatment.

Digester for the treatment of chips. James Fletcher (to Babcock & Wilcox Co.). U. S. 2,185,962, Jan. 2. Various structural, mech. and operative details.

Pressing wood pulp. E. I. Luk'yanov. Russ. 55,868, Oct. 31, 1939. The pulp is first satd. with a soln. of sulfite cellulose lye treated with $Fe_2(SO_4)_3$, filtered from the ppt., and treated with aq. soln. of albumin. The pulp is then dried at 60–80° to a 12–14% H_2O content and pressed at 160–80°.

Bleaching and refining paper pulp. Harold R. Murdock (to Champion Paper and Fibre Co.). U. S. 2,186,034, Jan. 9. A process of prepg. a bleached paper stuff comprises chlorinating the chlorinatable lignin compds. of a chemically produced raw pulp by treatment of the latter with Cl as such, solubilizing the chlorinated lignin compds. by treating the pulp with mild caustic alkali soln. and washing the so-solubilized compds. from the pulp; beating and partially hydrating the pulp to a degree just short of that required for hydrating the pulp to a degree approx. that required for papermaking; subjecting the substantially refined and hydrated pulp to an oxidizing bleach with a hypochlorite under conditions to bleach the pulp; and mechanically hydrating the bleached pulp, to the degree of hydration appropriate for paper-making, under mild hydration conditions.

Emptying apparatus for diffusers, pulp bins, etc., used in the manufacture of cellulose and paper. Olaf Qviller. U. S. 2,185,567, Jan. 2. Various structural, mech. and operative details.

Apparatus for screening cellulose fiber. Lauritz B. Schibbye (to Linköpings Armatur-och Metallfabriks Aktiebolag). U. S. 2,185,955, Jan. 2. Various structural details.

Papermaking machine. Geo. J. Forman. U. S. 2,185,913, Jan. 2. Various structural, mech. and operative details.

Papermaking machine. Wm. H. Millspaugh (to Sandusky Foundry and Machine Co.). U. S. 2,186,171, Jan. 9. Various structural, mech. and operative details.

Apparatus for delivering stock to the paper machine. Richard T. Lang (to American Voith Contact Co. Inc.). Can. 386,952, Feb. 20, 1940. Structural details.

Cotton yarn for drier felts. Boris Monsaroff and Walter S. Burrill (to Cosmos Imperial Mills Ltd.). Can. 387,121, Feb. 27, 1940. Cotton yarn is treated with a soln. of phenol or urea contg. a suspension of a powd. inorg. material, partially dried to remove surplus moisture, impregnated with formaldehyde, and heated to form a condensation on product with the powder interposed therein.

Alkaline earth paper filler. Otto Kress and Charles E. Johnson (to Institute of Paper Chemistry). Can. 387,132, Feb. 27, 1940. An emulsion of paraffin stabilized by a substantial proportion of casein in colloidal form is mixed with a sludge of finely divided alk. earth solids, the ratio of casein to paraffin being about 1:4, and an acidic reagent is added to set the emulsion.

Coated paper suitable for printing. Peter J. Massey. U. S. 2,185,859, Jan. 2. Various details of app. and operation for coating wet paper webs and then drying them.

Apparatus for coating paper or other film with a sensitized emulsion. Geo. C. Beidler. U. S. 2,185,049, Dec. 26. Various details of an app. designed to prevent buckling of the film.

Apparatus for testing the rupturing strength of sheet materials such as paper or textile fabrics. Samuel N. Senna (to B. F. Perkins & Sons, Inc.). U. S. 2,186,213, Jan. 9. Various structural, mech. and operative details.

24—EXPLOSIVES AND EXPLOSIONS

C. G. STORM

Firedamp: its occurrence in mines and possible utilization. J. Ivon Graham. *Colliery Guardian* **159**, 582–5, 626–30(1939).—CH_4 is the main constituent of the gases evolved from coal, but N and CO_2 may exist in appreciable quantity. Coal may contain extremely large amts. of CH_4, especially under pressure. Many samples of anthracite coal contained over 1000 cc. of CH_4 per 100 g., and com. grades of such coal evolve the CH_4 so slowly that they may retain a considerable quantity of the gas even after 5 months of storage. Bituminous coal has rarely been found that contains more than 300 cu. ft. of CH_4 per ton; it readily loses most of the gas. CH_4 from coal mines may be used (1) as a fuel for autos and buses (when compressed into cylinders) and (2) for fuel requirements at the mines. George Ayers

The determination of the firedamp content in mine air. T. David Jones and W. L. Gyles. *Colliery Guardian* **159**, 588–90(1939).—A comparison of (1) the McLuckie gas detector, (2) the M.S.A. methane detector, (3) the M.S.A. methane tester, (4) the Léon-Montlucon firedamp de-

tector and (5) the Ceag Monthuçon gas detector for CH_4-air mixts. up to 4.06% CH_4 content was made both in the lab. and underground (except for the M.S.A. methane tester). All were satisfactory, the max. differences in results obtained underground being: (1) 0.08; (2) 0.06; (4) 0.05; and (5) 0.07, resp. The time required for a detn. was: (1) approx. 10 min.; (2), (4) and (5) less than 1 min. George Ayers

Explosibility of semianthracite, low-volatile bituminous coal, and medium-volatile bituminous coal dusts. H. P. Greenwald. *U. S. Bur. Mines, Rept. Investigations* **3489**, 11 pp.(1940).—Data on the explosibility of 22 coal dusts contg. 8–31% volatile matter are presented. Rock dusting is necessary in mines working coals contg. more than 11% volatile matter unless the incombustible content of the coal dust is abnormally high. Alden H. Emery

Coal-mine explosions and coal- and metal-mine fires in the United States during the fiscal year ending June 30, 1939. D. Harrington and W. J. Rene. *U. S. Bur. Mines, Circ.* **7092**, 21 pp.(1939); cf. *C. A.* **33**, 2718[8]. 3
Alden H. Emery

Danger of explosion in N. W. Bohemian brown coal mines. F. Mayer. *Z. Berg-, Hütten- u. Salinenw. deut. Reich* **86**, 537–44(1938); *Neues Jahrb. Mineral., Geol.*, Ref. II, **1939**, 840–2.—Although CH_4 is present in comparatively small quantity combustible gases are in these brown coal mines because of the spontaneous inflammability of the coal; the gases consist of air, N_2, CO_2, CO, H_2, CH_4, C_2H_6, C_3H_4 and heavier hydrocarbons. Explosions are usually less violent than those due to fire-damp, but the brown-coal dust must be regarded as dangerous.
C. A. Silberrad

Method for extinguishing burning petroleum products. P. T. Bezuglov. *Neftyanoe Khoz.* **1939**, No. 8, 44–7.—A general discussion of causes of oil fires and methods of combating them. A. A. Boehtlingk

Carbon dioxide gas and water extinguish steel shaving fire. David E. Hatt. *Fire Eng.* **93**, 112(1940).—Approx. 2400 tons of warm, oil soaked shavings of fine texture ignited spontaneously. To extinguish the fire the material was spread out about 15 in. deep, cooled with CO_2 and wetted with water from spray and fog nozzles. About 3000 lb. of CO_2 and 700,000 gal. of water were used. Water alone could have been employed to extinguish the fire but it is likely that without the use of CO_2 the fire would have remained burning for a much longer period. Leopold Scheflan

History of the development of the rocket. Albert Hausenstein. *Z. ges. Schiess- u. Sprengstoffw.* **34**, 135–9, 170–4, 206–10, 237–42, 286–8, 306–8, 331–3(1939); **35**, 8–9, 32–4(1940). C. G. Storm

Ammonium nitrate explosives. Clyde O. Davis (to E. I. du Pont de Nemours & Co.). U. S. 2,185,248, Jan. 2. NH_4NO_3 about 92% is used together with a normally solid nitrated aromatic hydrocarbon such as dinitrotoluene or mononitronaphthalene 4–5% and with a normally solid O-free org. "fuel" sol. in the nitrated aromatic hydrocarbon when the latter is molten, such as diphenylamine or *p*-toluidine in a proportion no greater than that of the nitrated aromatic hydrocarbon. Such explosives have good sensitiveness. Cf. *C. A.* **33**, 9648[1].

Smokeless powder. Hercules Powder Co. Brit. 508,914, July 7, 1939. A small amt., e. g., 1%, of ground glass, Ca silicide, Sb sulfide, powd. Sb, Sb oxide, $CdCO_3$, CdO, Cd and (or) Co, capable of preventing rust formation in the gun barrel after firing without increasing the speed of combustion, is incorporated in smokeless powder during the prepn. thereof. The powder may be coated with the rust-preventative substance(s). 4

Delay detonators. Lawton A. Burrows and Walter E. Lawson (to E. I. du Pont de Nemours & Co.). U. S. 2,185,371, Jan. 2. A delay compn. of predetd. burning speed is used contg. an oxidizing agent such as $KMnO_4$ and an alloy of Sb with at least one metal such as Fe, Bi, Cu, Cd or Pb whose heat of combustion per unit volume is substantially different from that of Sb. 5

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Dyes and other synthetic organic chemicals in the United States. Anon. *U. S. Tariff Comm.*, Rept. No. **132**, 57 pp.(1937). G. G.

The membrane-permeability of dyestuffs. I. Information on the dialysis velocity of Orange II. Tetunosuke Nisi. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 341–2 (1939)(in German).—The dialysis const., k, equals $2.303v\{1/[At(v + V)]\}\log\{1/[1 - (c(v + V)/vC_0)]\}$, where A = surface of the parchment, paper membrane, V = vol. of outer liquid, v = vol. of inner liquid, c = concn. of Orange II in outer liquid in mg./l., C_0 = initial concn. of Orange II in inner liquid in mg./l. and t = time in min. With decreasing concn. of Orange II solns., k reaches a max. and then decreases with further decrease in concn. With increasing NaCl concn., k quickly becomes const. with high Orange II concns., but only slowly rises to a const. value with low Orange II concns. Increase in temp. results in a linear increase in k. With increasing H_2SO_4 concn. up to 0.5 N, k increases; with a definite H_2SO_4 concn., an increase in NaCl concn. results in rapid increase of k to a const. value. G. Ayers 7

Vat dyes of the flavanthrone series. III. Tosio Maki and Seni-iti Kitamura. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 410–12(1939)(in German); cf. *C. A.* **31**, 4499[9].—Into 50 g. $PhNO_2$ and 8.5 g. $SbCl_5$ at 20° 3 g. powd. 2,3-bromaminoanthraquinone (I) was introduced and the mixt. allowed to stand overnight (approx. 18 hrs.); it was then heated rapidly to 210°, maintained at that temp. for 15–20 min, and the dyestuff filtered off at approx. 140° by suction, washed thoroughly with $PhNO_2$ at approx. 100°, then with alc., then extd. with 10% HCl soln.; it gives pure 3,3′-dibromoflavanthrone (II) (0.93 g.) in 33.1% yield. Increase in the reaction temp. up to 210° increases the yield of II and decreases the yield of by-products; prolonged heating at 210° gives a brownish impure product. The highest yield of II is given when $SbCl_5$:I = 2.8:1. II crystallizes from hot $PhNO_2$ in reddish yellow needles; it colors H_2SO_4 orange-red and, from an alk. hyposulfite bath, colors cotton a bright yellowish orange (deeper tint than that given by ordinary flavanthrone and rather similar to that of the pyranthrones). II is not identical with Indanthrene Yellow R (probably formed by partial bromination of flavanthrone), which contains less Br and is yellower than II. When the time of heating at 210° is 5 min., 3,3′-dibromoindanthrone (III) is the main product; III is a blue dyestuff (for cotton from the hyposulfite bath) which can be purified by extn. with hot $PhNO_2$. When the time of heating at 210° is prolonged (60 min.), III by further condensation forms a yellow-green *substance*, $C_{48}H_{18}O_4N_2Br_2$ (IV), somewhat sol. in boiling PhCl and in $PhNO_2$ with a clear-green color (without fluorescence). IV crystallizes from $PhNO_2$ as a dark-green cryst. powder having a green streak; it colors H_2SO_4 yellow-brown and dyes cotton yellow-green from a hyposulfite bath at 60°. When the $PhNO_2$ from the prepn. of II is allowed to stand, III and IV sep. in amts. equal to about 5% of the I used. A red-brown, cryst. mol. compd. is formed from 1 mol. each of $PhNO_2$, $SbCl_5$ and I. When the $PhNO_2$ in the above method for the prepn. of II is replaced by *o*-$C_6H_4Cl_2$, and the mixt. boiled 60 min., there result no II, no mol. compd. and only traces of dibromindanthrone. George Ayers 8 9

Removal of a sulfur black dye from suspension by flotation methods. B. R. Clanton, F. K. Cameron and J. E. Magoffin. *Textile Research* **10**, 201–6(1940).—The flotation of S black suspensions is dependent on the

electrokinetic potential of the dye as measured by the migration velocity. Some new floating agents, including mono-, di-, and tri-amylamine, have been found effective alone and in mixts. Partial coagulation of the dye with electrolytes or pos. colloids before addn. of floating agents is effective. The improvement is directly connected with the change in the electrokinetic potential of the dye caused by the coagulating agent. W. H. Boynton

The phthalocyanine dyes. Albert Sander. *Chem.-Ztg.* 64, 73–5(1940).—A review with 35 references. E. H. 2

Pechman dyes. Formation of the ester of a new acid, isomeric with the yellow monoacid. Paul Chovin. *Compt. rend.* 209, 169–71(1939); cf. *C. A.* 33, 2341[8], 4980[8].—Hydrolysis of the red and yellow dyes of Pechman with alc. KOH yields a monohydrated acid (I), a yellow dihydrated acid (II) and a white pseudo-dihydrated acid (III). The Me esters of I and II are not stable. The Me ester of III is canary-yellow, m. 165°. C. W. Sondern 3

The "suprafiks" dyes. N. S. Aleksandrov and A. G. Kolesnikova. *Byull. Ivanovo Nauch.-Issledovatel. Tech. Inst.* 1938, No. 6–7, 86–7; *Khim. Referat. Zhur.* 2, No. 5, 107(1939).—The use of indanthrene dyes requires a preliminary partial reduction of the dye by heating it with $NaHSO_3$ and with a base. About 12–20% of the indanthrene pastes possessing a fine structure can be used without preliminary reduction. However, the particles become denser when subjected to freezing temps. The "suprafiks" dyes are indanthrenes in the form of exceedingly fine pastes and are devoid of these disadvantages. Results of production-scale tests with 4 samples of "suprafiks" are given: Violet RRN, Violet BBK, Yellow GGD and Orange GK. In the dyeing of the textiles with the "suprafiks" dyes the textiles were satd. with the unreduced dispersed dye and reduced in a jigger. An even color without specks was obtained. W. R. Henn 4

Three-phase light sources of interest to the textile industry as applied to accelerated light-fastness testing equipment and color-matching lamps. M. J. Dorcas. *Am. Dyestuff Reptr.* 29, No. 5, *Proc. Am. Assoc. Textile Chem. Colorists* P110–16(1940).—A discussion of machines for the accelerated testing of the fastness to light of dyed fabrics and other colored objects and an artificial light to supplement or replace inadequate or varying daylight for the purpose of matching colors or detg. the color of objects as practiced in the com. classification of commodities. W. H. Boynton 5

An accelerated light-fastness test in use at Shirley Institute. H. Hunter. *J. Soc. Dyers Colourists* 56, 64–7 (1940).—The problem was to devise a method of subjecting test samples to irradiation equiv. as nearly as possible in quantity and quality to sunshine amounting to at least 2000 hrs. in a min. practical test period. A Stelmor cinema projector consuming 65 amps. at 40 v. has the arc situated just outside the focus of a Cr-plated twin parabolic mirror of 8.5-in. aperture. A glass lens 3 in. in diam. is mounted on the axis of the projector system 5 in. from the arc crater. Light is concd. on the target at a distance of 30 in. from the arc and light intensity is about 200,000 foot candles or 20 times that of noon summer sunlight. A blast of air (250 cu. ft. per min.) directed onto the samples reduces the temp. of the samples below 20°. The air is humidified by steam jets. The equipment is described and the technique of testing is outlined. The first cost of the method is little over that of the fadometer, but running costs are much higher. Advantages are speed and accuracy. W. H. Boynton 6

Mechanized equipment for the production of diazo solutions. A. V. Lebedev and V. Ya. Davydov. *Byull. Ivanovo Nauch.-Issledovatel. Tech. Inst.* 1938, No. 6–7, 87–96; *Khim. Referat. Zhur.* 2, No. 5, 106–7(1939).—When diazo solns. are prepd. by manual labor in textile mills the amt. of the oxides of N in air reaches 0.18 mg./l. during the prepn. and 0.24 mg./l. during the filtration of the product. In mills that use semimechanized methods the content of the oxides of N in air was reduced to 0.008–0.01 mg./l. (normal 0.015 mg./l.). L. and D. developed a mechanized equipment which ensures all sanitary and hygienic requirements. W. R. Henn 7

Colors in the Renaissance. L. G. Derjisseau. *Ciba Rev.* 2, 601–3(1939).—A historical discussion of the use of various dyes. Leopold Scheflan 8

Dyeing in France before Colbert. H. Wescher. *Ciba Rev.* 2, 618–25(1939).—A historical description of dyeing textiles. Leopold Scheflan 9

The French dyeing industry and its reorganization by Colbert. H. Wescher. *Ciba Rev.* 2, 643–6(1939).—Historical. Leopold Scheflan 10

Great masters of dyeing in 18th Century France. H. Wescher. *Ciba Rev.* 2, 626–41(1939).—A historical description including an illustration of an old app. for the manuf. of "oxidized chlorate of lime" for Turkey-red dyeing and other ancient app. Leopold Scheflan 11

Weaving and dyeing in North Africa. Jean Gallotti. *Ciba Rev.* 2, 738–45, 747–51, 753–6, 758–60(1939).—A survey of the industry in Morocco, Algeria and Tunisia. Leopold Scheflan 12

Stable color with indigosols. P. V. Moryganov and S. A. Plaksin. *Byull. Ivanovo Nauch.-Issledovatel. Tech. Inst.* 1938, No. 6–7, 66–87; *Khim. Referat. Zhur.* 2, No. 5, 105–6(1939).—Methods for the dyeing with different dyes are given. To avoid the premature oxidation of indigosols during drying it is recommended to add NH_3 to counteract the acidity produced by the addn. of the NH_4 salts. Best results were obtained by addn. of $(NH_4)_2C_2O_4$. Addn. of alizarin and ricin soap gave good results. $K_4Fe(CN)_6$ and NH_4 vanadate were investigated as catalysts. A prolonged boiling caused up to 23.5% loss of strength of the fibers. W. R. Henn 13

Rayon dyeing and finishing. E. Hazeley. *Can. Textile J.* 57, No. 6, 30, 32, 39–41, 52–3(1940).—Practical data are presented on faults which can be corrected during dyeing processes (use of softened and purified water for processing, bleaching with H_2O_2, routine test for degradation of cellulose, uneven dyeing around the skein, poor penetration in skein dyeing), faults for which the dyer is not responsible (weft or filling bars due to yarn shading and cloth structure, streakiness in crepe fabrics, warp stripes, streaks due to scouring and sizing, tendering by vat dyes and tension effects), and dyeing faults in the production of rayon (age of viscose, operative defects and coagulating bath constituents, effective control of yarn quality, selection of level dyeing dyes and the performance of dyes). Leopold Scheflan 14

Dyeing of fabrics for work clothes. E. Dutoit. *Teintex* 5, 54–7(1940).—A discussion of the prepn. and dyeing of clothes made of 80% cotton and 20% cellulose schappe. Saverio Zuffanti 15

A noninjurious dyeing process for Tiolan-wool mixtures. Karl Soiron and Wilh. Thierron. *Melliand Textilber.* 20, 646–9(1939).—Tests showed that Tiolan is more severely weakened than wool by the concns. of acid used in dyeing. This is attributed to the splitting off of HCHO. Tiolan also takes up dyes more rapidly than wool; thus dyeing is uneven on mixts. of the 2 fibers. This effect is increased by the fact that the HCHO which is split off from the Tiolan tends to reserve the wool. When hexamethylenetetramine is added to the dye bath the Tiolan retains its strength to a much greater degree. Levelling is effected by dyeing 1st at low temp. and low acidity, then adding fresh dye and more acid and bringing to a boil. Exptl. data and sp. dyeing recipes are given for 6 different classes of dyes. Anthony M. Schwartz 16

Density of wool in relation to acid dyeing. P. M. Heertjes. *Atti X° congr. intern. chim.* 4, 755–62(1939).—The dyeing process of wool by acid dyes is studied. By means of gas-volumetric d. detns. using He gas as an imbibition medium, it has been shown that the dyeing of wool with acid dyes is a chem. process by which the dye penetrates, at least partly, into the micelle substance. By the acid dye process an extra increase of vol. of the micelle substance is caused. This extra increase of vol. is directly proportional to the size of the dye mol., however, on the understanding that only mols. above a certain size will commence to cause the said increase of vol. This can be 17

explained by the peculiar structure of the wool keratin. D. Jorysch

The technique of early cloth printing. R. Haller. *Ciba Rev.* 2, 933–7(1939).—Historical. L. S.

The earliest specimens of cloth printing. Gustav Schaefer. *Ciba Rev.* 2, 914–19(1939).—Historical. Leopold Scheflan

Medieval cloth printing in Europe. Gustav Schaefer. *Ciba Rev.* 2, 921–32(1939).—Historical. L. S.

Textile printing up to the year 1500. Gustav Schaefer. *Ciba Rev.* 2, 938–9(1939).—Historical. L. S.

"Painted" printing process. Metzl. *Melliand Textilber.* 20, 287(1939).—A new style of textile printing, especially suitable for rayon and silk fabrics, is described. It allows the production of an appearance closely resembling that of a H_2O- or oil-painting by printing a lustrous fabric with a matt pattern before or after printing with a multicolor or 2-tone pattern with the aid of acid, basic, and vat dyes. Recipes of printing pastes for obtaining the matt and color effects are given. B. C. P. A.

Printing on plush. L. Ferré. *Teintex* 5, 57–62(1940).—For plate printing the following mixt. is recommended: 310 g. of an acid dye, 325 g. of powd. British-gum, 75 g. of glycerol, 25 g. $KClO_3$, 130 g. $Na_2C_2O_4$, 130 cc. NH_4OH, and 5 l. of H_2O. Several other mixts. are also included. Saverio Zuffanti

The physical properties of thickeners (for textile printing). Georg Hasse. *Melliand Textilber.* 20, 655–8(1939).—Viscosity as measured by the falling-ball method gives no indication of how a thickener will behave in actual practice on the printing machine. The use of a rotating-cylinder type of viscometer, however, shows that most thickeners possess a structural viscosity due to their colloidal nature. The viscosity decreases with increasing speed of the cylinder. Such measurements can be directly correlated with the behavior of the thickener in practice, and afford an excellent method of scientifically evaluating these substances. Anthony M. Schwartz

Causes and effects of pulmonary tuberculous infection among seamstresses. G. Wohlhueter de Loriol and R. Wohlhueter de Loriol. *Schweiz. med. Wochschr.* 69, 1228(1939).—In Strasbourg, the amt. of dust is very high, even in well-equipped factories. The dust comes not only from the cloth itself but also from the dressing of the material. Chem. examn. frequently showed large amts. of Si. It was found that 90 women had a developing tuberculosis. Maurice M. Rath

Color test for the detection of bleached woolen fibers. J. Pinte. *Atti X° congr. intern. chim.* 4, 785–8(1939).—The bleaching of woolen fibers leaves residual reaction products on the fibers. These products are produced by the action of oxygen on the proteids. They are difficultly removed by washing and they can be detected by treatment with KI and starch in presence of HCl. Woolen fibers are macerated in distd. water which has been repeatedly boiled to remove dissolved oxygen and gases. A mix of a soln. of KI, starch paste and dil. HCl is slowly added and allowed to diffuse without agitation. Bleached woolen fibers produce a violet color which turns blue on standing. This reaction is sp. for wool and silk and will be pos. only if bleached fibers are present. Chlorinated wool will give a neg. test. The residual quantity of combined oxygen can be estd. quantitatively. A weighed quantity of woolen fibers is macerated with distd. water and is treated with NaI, $MnCl_2$, dil. HCl and starch paste. The reaction mix is titrated with $Na_2S_2O_3$. The end point is the disappearance of the blue color. A blank is run on unbleached fibers. The difference in titration corresponds to the residual oxygen on the fibers. D. Jorysch

The sampling of domestic wool for shrinkage determination. Robert H. Burns. *Textile Research* 10, 193–200(1940).—The terms shrinkage, yield and clean content are defined, methods of obtaining shrinkages on lots of wool are explained and research work on wool shrinkage tests are reviewed. Selection methods and lab. and mill-scouring methods are explained. The grading of 10 bags, of 5 bags and of every *n*th fleece is compared to that of an entire clip. The grading of the 1st bag sheared from each band is usually coarser than that of the last bag sheared from each band. The cause is explained. The variations in shrinkage of samples drawn by different operators and between the 1st and 4th samples are given and are found not to be significant. W. H. Boynton

Degradation of staple rayon by washing [with detergents.] H. Böhringer and H. Seyfert. *Melliand Textilber.* 20, 353–5(1939).—Numerous curves are given to show the relative decreases of tensile strength and degree of cellulose polymerization (*P*) produced by washing cotton and 2 types of cellulose staple rayon 0–50 times with various soap + Na_2CO_3 and soap + oxidant detergent solns.; the results are further correlated with data obtained by fractionating solns. of the nitrocelluloses (Rath method) derived from these fibers. It is concluded that *P* is a satisfactory criterion of the durability of a staple rayon material although refinement of the Staudinger method of detn. is desirable. Oxidizing detergents deteriorate staple rayon and are not recommended for general use. B. C. P. A.

Recent developments in rayon and some of the newer manufactured textile fibers. F. Bonnet. *Rayon Textile Monthly* 21, 82–3, 108, 145–6(1940); cf. *C. A.* 34, 1490⁶.—A review. W. H. Boynton

Physical and chemical methods for testing staple rayon. Walther Schieber. *Melliand Textilber.* 20, 617–25(1939); *Angew. Chem.* 52, 561–8(1939); cf. *C. A.* 34, 1181⁹.—Undue emphasis has been laid on wet and dry tensile strength as an index of the quality of staple rayon. Material of high tensile strength may have other characteristics which render it unfit for general use. Phys. tests which should be applied to completely evaluate the fiber are: fastness to knotting, wet and dry tensile strength, wet and dry total elongation, elastic elongation, relative wet strength, fastness to creasing, retention of flexibility, work required for elongation to the elastic limit, work required for elongation to the breaking point. Chem. tests which should be applied are: titer, av. polymerization no., alkali soly., area under the Dolmetsch soly. diagram, orientation and packing d. Quant. relations among these properties are presented for a no. of com. fibers. The bearing of each phys. and chem. property considered on working characteristics, wearing quality, and resistance to washing and bleaching is thoroughly discussed. These tests are especially important and valuable in developing new types of rayon and fibers for special purposes. Anthony M. Schwartz

Determination of lanital in the mixed fabrics with natural wool. G. Chessa. *Chim. ind. agr. biol.* 16, 37(1940).—Wash 1 g. of sample with alc.-Et_2O, then with H_2O, dry at 110–20°, treat with 50 cc. of a reagent formed from 100 cc. of 28°Bé. glycerol and 15 cc. of 10% HCl, and boil under reflux for exactly 3 min. Dil. the soln. with 50% alc., filter, wash the insol. matter, dry at 110–20° and weigh. The reagent dissolves lanital but not natural wool. G. A. Bravo

Studies on the protein artificial fiber. III. Chemical change occurring, during ripening of alkali caseinate. H. Z. Utaka. *J. Soc. Chem. Ind., Japan* 42, Suppl. binding 412–13(1939); cf. *C. A.* 34, 2179⁹.—In the presence of a slight excess of alkali, casein reacts rapidly with NaOH soln., forming a series of gelatinous hydrates which finally pass into soln. During ripening of the soln. at 15–20° for 7–11 days, the slight excess of NaOH, present at the beginning of the ripening period, gradually combines with the casein. Acids ppt. hydrated casein from an alk. soln. **IV. Behavior of metallic hydrate toward the formation of metallic alkali caseinate.** *Ibid.* 413–14.—The best soln. for spinning is prepd. by bringing together the reagents in water in the proportion, casein:NaOH:Cu = 1:0.05:0.006. A complex Na Cu caseinate soln. is formed and finally this soln. is not coagulated by acids. It is from this soln. that wool-like fiber of great tenacity is prepd. The soly. of casein in alkali soln. is markedly increased by Cu and Co hydroxides, resp. The colloidal state of alkali caseinate is not influenced by the valency of Fe in Fe hydroxide. George Ayers

Vinyon—a new textile fiber. F. Bonnet. *Am. Dye-*

stuff Reptr. **29**, No. 5, *Proc. Am. Assoc. Textile Chem. Colorists* P116–20(1940).—See *C. A.* **34**, 2179⁹. W. H. Boynton

The quantitative determination of casein fiber content of mixed goods. K. Hartung. *Melliand Textilber.* **20**, 697–8(1939).—Casein fibers are attacked and rendered sol. by pepsin and HCl, provided their HCHO content has been previously removed by treatment with H_2SO_4. Wool and other fibers are unaltered by this treatment. 2
The method of analysis, applicable to dyed or undyed material, is as follows: a 5 g. sample is extd. with ether in a Soxhlet app., dried at 105°, and weighed. It is then boiled ½ hr. in 200 cc. of 0.1–0.2% H_2SO_4, the sol. being maintained by addns. of hot water. After thorough rinsing it is added to a soln. of 2 g. pepsin and 0.5 cc. concd. HCl in 100 cc. water, and kept at 60° for 3 hrs. with occasional stirring. It is then rinsed in cold water, dried and weighed. A brief review of previous qual. and 3
quant. methods is given. Anthony M. Schwartz

The structure of artificial fibers and its relation to mechanical and dyeing properties. W. Weltzien. *Melliand Textilber.* **20**, 645(1939).—Cu-ammonia-process rayon (I) takes up dyes from aq. soln. much more rapidly than does viscose-process rayon (II). Similarly, the dyeings on I are less fast to water washing than the dyeings on II. A preliminary treatment with NaOH soln. has no 4
effect on the dyeing rate of I but greatly increases the dyeing rate of II. Preliminary stretching has no effect on the dyeing rate of I but increases the dyeing rate of II. These effects cannot be explained by the very small differences in av. polymerization no., chain length, and orientation between the 2 rayons. They are readily explained if we postulate that II possesses a thin surface layer or zone which is resistant to penetration and swelling, and that I has no such cortex. This theory is borne out 5
by microscopic examn. of the cross-sectioned dyed fibers. Lengthwise stretching or shrinking of II in NaOH solns. is greatly affected by addns. of salt to the bath, but no such effect is observed in the case of I. This also indicates that II has a relatively impenetrable outer zone, whereas I is homogeneous throughout its cross section.
Anthony M. Schwartz

New methods of evaluating staple rayon. Otto Eisenhut. *Melliand Textilber.* **20**, 625–30; *Angew. Chem.* **52**, 568–72(1939).—See *C. A.* **34**, 1182⁵. A. M. S. 6

The rapid preparation of cross sections of cotton fibers. Z. Yosida. *Melliand Textilber.* **20**, 696–7(1939).—A detailed procedure for cross sectioning is given, which is applicable to cotton and other fibers of small diam. Previous rapid methods have been successful only with fibers of relatively large diam. such as the coarser rayons.
Anthony M. Schwartz 7

Testing the stiffness of yarns and twines. Donald C. Scott. *Am. Dyestuff Reptr.* **29**, 77–80(1940).—A paper dealing with the stiffness of bending. Methods of deflecting yarn are discussed. The elastic theory of loop, the application of theory to practice and the effect of sizing on yarn stiffness are considered briefly. High drying temps. produce yarn stiffness. Increase in moisture content or regain usually makes for a softer and more 8
pliable yarn or fabric. W. H. Boynton

Sisal research. W. H. Gibson. *Research Linen Ind. Assoc., Lambeg* **1939**, No. 3, 14 pp.—A report on work carried out at Lambeg from July 1, 1937, to Dec. 31, 1938, dealing with the growth of the plant and the separation, treatment and applications of the fiber.
B. C. P. A.

Newer ideas in textile chemistry. T. W. Whattam. *Can. Textile J.* **57**, No. 6, 34–6(1940); cf. *C. A.* **34**, 2607⁸. 9
—The phys. activities of surface-active agents are related to emulsification, detergency, and penetration during dyeing and wet processing operations. Wetting agents are not necessarily good penetrating agents for textile-chem. purposes. Penetration depends on the size of the mol. aggregates of the agent as compared to the spaces between the mols. of the fiber. Cation-active compds., e. g., cetylpyridinium bromide, are discussed; they ppt. 1
direct cotton dyes and can be used for the fixation of such dyes on cotton. Textile-fiber structure, the x-ray analysis of fiber structure and the sepn. of mols. relating to dyeing processes are discussed. Leopold Scheflan

Influence of finishing treatments on weight, dimensions and quality of textile materials. Schmidt. *Melliand Textilber.* **20**, 201–4, 273–6, 345–52, 421–8(1939).—Complete data and numerous graphs of special interest to fabric designers are given to show the changes produced in woolen and worsted fabrics by such treatments as drying, shearing, pressing, decatizing, shrinking, tentering, and milling. B. C. P. A.

Creping of cloths. Joseph Ricre. *Teintex* **5**, 21–8(1940).—A historical discussion of creping, which covers many patents and formulas, is followed by some industrial applications. Prepn. of bath, impregnation, choice of catalyst, drying, and polymerization are discussed. Pictures and drawings of the equipment are included. *Ibid.* 66–70.—The effect of various creping processes on 217 dyes is discussed and a list of the changes of shade produced is given. Means of measuring creping are given and pictures of app. included. Saverio Zuffanti

Preparation, dyeing and finishing of crepe rayon fabrics. Louis Bonnet. *Teintex* **4**, 519–25(1939).—B. discusses the following types of fabrics: fancy crepes; crepe de Chine and crepe marocain; acetate chain and viscose tram; acetate chain, viscose crepe; chain and tram of Cu rayon; acetate chain and tram of Cu rayon; chain and tram of viscose; crepe satins with viscose chain and crepe viscose tram and with chain and tram of Cu rayon; crepon; georgette crepe; craquelé; flamenga. S. Z.

The technique of modern carpet manufacture in Europe. A. Varron. *Ciba Rev.* **2**, 822–5(1939).—A brief illustrated description of various chem. and mech. treatments.
Leopold Scheflan

Treatment of furs. Vandenhaute. *Teintex* **5**, 29–32(1940).—Bleaching, tanning and dyeing of furs are discussed. The skins should not be soaked too long. A little PhOH added to the soaking bath prevents bacterial putrefaction. The soaking should be accelerated by agitation. For bleaching the following are recommended: $KMnO_4$, SO_2 or, better, H_2O_2. For tanning the following bath is strongly recommended: 5 kg. $Al_2(SO_4)_3$, 5 kg. common salt, 2 kg. gambier, 6 kg. rye flour, and 100 l. of H_2O. Glycerol or a sulfonated olive oil may also be added to soften the pelts. Other tanning baths are also discussed. Numerous dye-bath formulas are included. S. Z.

Finishing of loose plushes. L. Ferré. *Teintex* **5**, 17–21(1940).—A discussion of treating and dyeing of plushes. Detailed conditions and bath formulas are included. Saverio Zuffanti

Quality control in a woolen mill. Werner Von Bergen. *Am. Dyestuff Reptr.* **29**, No. 4, *Proc. Am. Assoc. Textile Chem. Colorists* P84–92(1940).—Lab. facilities at the plant of the Forstmann Woolen Co. are outlined. Control work is done by the chem., phys. and optical depts. Lab. methods of treating raw wool and scoured wool for judging purposes are outlined. A rapid method for fat detn. is as follows: Place one 5-g. sample in a metal cup and pour in 29 cc. of CCl_4. Press the wool down hard in the cup with the plunger 10 times, let stand 1 min., press down 10 times more and let stand 1 min. Now plunge 10 times and then hold the cup over the graduate and squeeze till 13 cc. of liquor is in the graduate. Empty the graduate into the container. For scoured wool, top and worsted yarn: Place the container in the greasometer and dry about 3 min. Remove from the greasometer and let cool with cover off 1 min. Put cover on, weigh and from this wt. subtract the clean wt. of the container. Divide the difference by 2. If the result is less than 0.3% add 0.2%, if between 0.30 and 0.50%, add 20% of the result and if over 0.50% add 10% of the result. The amt. of the size on warp yarns for best weaving conditions should be 15%. The test for acids in carbonized cloth is important because percentage of H_2SO_4 above 1% may result in severe damage. W. H. Boynton

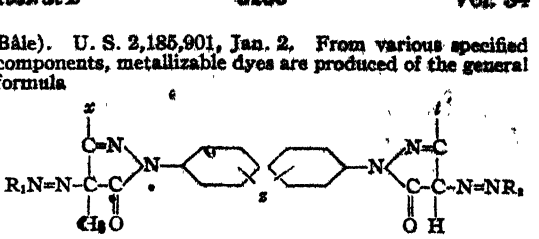
Health hazards in the dry-cleaning industry [with special reference to chlorinated hydrocarbon and petro-

leum solvents]. J. P. Russell, *Calif. State Dept. Pub. Health, Weekly Bull.* 19, 5–6(1940). J. Pinchack

Development of rancidity in Stoddard dry-cleaning solvent. Adrian C. Smith, Charles S. Lowe and George P. Fulton. *Ind. Eng. Chem.* 32, 454–60(1940).—Fatty matter accumulates in dry-cleaning solvent primarily from the soap used and secondarily from soil in the garments which are cleaned. If not removed from the solvent this becomes rancid and causes an objectionable odor in the garments that are cleaned later. A series of practical runs were made during which only filtration and adsorption methods of treating the solvent were used. The increase in acid no. and residue in the solvent was followed. A modification of the Kreis test and a modified peroxide detn. were developed which were useful in detg. incipient rancidity. These were usually pos. several runs before objectionable odors developed in the clothes. Electrometric titration of the residue obtained from the used solvent indicates that as rancidity develops low-mol.-wt. acids are produced which have a buffering action. Serious objections are raised against using the H_2SO_4 absorption test for checking the condition of the solvent with respect to rancidity. Charles R. Phillips

The souring operation [in laundering]. I. Functions of the sour, properties of sours, notes on application. C. H. Bayley. *Laundry Dry Cleaning J. Can.* 19, No. 11, 15–17, 21(1939).—A discussion containing a tabulation of various properties of the common laundry sours. Charles R. Phillips

Fabric damage [in laundering]. J. Bryn Lewis. *Laundryman* 5, No. 10, 5–7, 16–17(1939).—Fabric damage during laundering can be traced largely to faulty laundering practice, to fabric or dye construction not suitable to laundering, or to misuse in the hands of the owner. Damage of the first type can be largely eliminated by care in the use of bleaches, alkalies and sours by the laundry operator. Photographs are given of several fabric defects. Charles R. Phillips



The effect of sodium bicarbonate on the bleaching of linen. B. V. Moryganov and L. V. Gur'yanov. *L'no-Pen'ko-Dzhutovaya Prom.* 1938, No. 10, 35–42; *Khim. Referat. Zhur.* 2, No. 2, 116(1939); cf. *C. A.* 33, 9657[5].—The bleaching process was controlled by the amt. of Cl_2 used, by the breaking strength of the cloth, by the elongation on breaking, by the capillarity, by the degree of whiteness and by the stability of the white color to steaming. The addn. of $NaHCO_3$ in the first treatment increases the whiteness of the cloth 3–4% and reduces the time of the treatment from 3 to 1 hr. The treatment should be performed at a 4 g./l. concn. of the active Cl with addns. of Na_2CO_3 (0.5 mol./mol. of NaOCl) at 20–30° for 1 hr. The second treatment of the cloth should be performed at a concn. of NaOCl corresponding to 3 g./l. of the active Cl with an addn. of $NaHCO_3$ (1.5 mol./mol. of NaOCl) and should last for not more than 1 hr. The whiteness of the cloth is thereby increased 1.2%. Expts. performed under production conditions confirmed the lab. results. A bleaching of flax textiles in a continuous process with an addn. of $NaHCO_3$ into the bleaching soln. was successfully obtained. W. R. Henn

Old and present techniques of bleaching silks. C. Thibaud. *Teintex* 5, 62–6(1940).—Boiled silks, supple silks and ordinary silks are discussed. A discussion on scouring and bleaching is also included. S. Z.

Sodium hexametaphosphate (Markuze) 14. Fire-resisting compns. [for coating or impregnating textiles] (Brit. pat. 509,069) 13. App. for testing the rupturing strength of textile fabrics (U. S. pat. 2,186,213) 23.

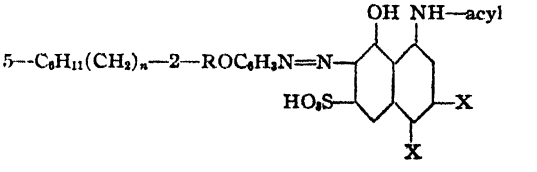
Zanker, W.: Deutscher Faerber-Kalender, 1940. Munich: F. Eder Verlag. M. 5 or $2.00. Reviewed in *Rayon Textile Monthly* 21, 194 (1940).

Azo dyes. Max Schmid (to Soc. pour l'ind. chim. à Bâle). U. S. 2,185,901, Jan. 2. From various specified components, metallizable dyes are produced of the general formula



where R_1 and R_2 are monocyclic aromatic nuclei of the benzene series contg. a COOH group standing in *o*-position to the —N=N— group, *x* and *i* stand for H, CH_3, COOH, $COOC_2H_5$ or phenyl, and *z* stands for a connecting member of the formula —NH—*a*—NH—, where *a* stands for a member of the group consisting of the carbonyl group and a triazine compd. and, where the —NH— groups are linked in a position different from the 2′-position to the phenyl radicals standing in 1-position to the pyrazolone nuclei, which products are yellow to brown powders dyeing fast yellow tints.

Azo dye. Werner Zerweck and Ernst Heinrich (to General Aniline Works). U. S. 2,186,226, Jan. 9. From 2-(2,3-hydroxynaphthoylamino)naphthalene and 1-methoxy-2-aminobenzene-4-sulfonbutylamide, a monoazo dye is obtained which when prepd. on vegetable fiber yields bright red shades of good fastness to washing and boiling and to light.

Vat dyes. R. P. Lastovskiĭ. Russ. 55,839, Oct. 31, 1939. 3,6-Diaminocarbazole is condensed with *α*-chloroanthraquinone in the presence of anhyd. AcONa and Cu salts or Cu powder.

Vat dyes. V. D. Lyashchenko and I. V. Grachev. Russ. 55,969, Oct. 31, 1939. Vat dyes are prepd. from 1,4,5,8-naphthalenetetracarboxylic acid or 3,4,9,10-perylenetetracarboxylic acid and aromatic *o*-diamines by heating in an aq. medium under pressure.

Acid wool dyes. Carl T. Schultis and Ernst Korten (to General Aniline Works). U. S. 2,184,948, Dec. 26. From various specified components, acid wool dyes are obtained of the general formula

where C_6H_{11} is cyclohexyl, acyl stands for a member selected from the group consisting of aliphatic and aromatic carboxylic and sulfonic acid radicals, R stands for a member selected from the group consisting of lower alkyl radicals and of araliphatic and aromatic radicals of the benzene series, *n* stands for one of the numbers 1, 2 and 3, one X means H and the other X a sulfonic acid group, which dyes dye animal fibers red shades of good fastness. Cf. *C. A.* 33, 4795[6].

Triarylmethane dyes. I. G. Farbenindustrie A.-G. Brit. 508,856, July 5, 1939. Addn. to 472,757 (*C. A.* 32, 1480[6]). Chromable dyes are made by condensing 1 mol. of a halomellitic acid or an anhydride thereof with 2 mols. of an aromatic OH compd. having in *m*-position to the OH a substituted NH_2, 2nd OH or alkoxy group and having a reactive H atom in *p*-position to the substituted NH_2, 2nd OH or alkoxy group, and then exchanging the halogen atom in the product by reaction with NH_3, an amine, an aromatic sulfamide or a hydrolyzing agent. They dye animal fibers in an acid bath orange, yellow to bluish-red and violet shades, the fastness of which is enhanced by after-chroming; they are also suitable for chrome-printing on cotton, viscose rayon, etc. They may be chromed in substance to form Cr complex salts that dye fibers in an acid bath clear fast tints. They may also be chlorinated to form dyes. Among examples, *m*-diethylaminophenol and 5-bromotrimellitic acid anhydride are

stirred together 2 hrs. at 170–180°, the melt is dissolved in a Na_2CO_3 soln. which is then acidified with AcOH and the dye, sepg. as free acid, is filtered with suction, washed with H_2O and dried; it dyes animal fibers red.

Sulfur dyes. N. A. Zaitsev. Russ. 55,822, Oct. 31, 1939. A mixt. of S, 3-nitrocarbazole and phenol is heated to the b. p.

Blue sulfur dye. V. N. Polyakov and L. I. Vasil'eva. Russ. 55,850, Oct. 31, 1939. 4-Aminotolyl-4-hydroxyphenylamine is treated with a soln. of sulfite at a temp. not exceeding 5° and the product is heated with a polysulfide.

Sulfur dyes. N. A. Zaitsev. Russ. 55,845, Oct. 31, 1939. A mixt. of benzidine, carbazole and S is heated above 180° with the addn. of sodium acetate or sodium formate or glycerol or sugar-like substances. The dye is sepd. in the usual manner.

Dyes of the anthraquinonebenzacridone series. Wilhelm Bauer (to General Aniline Works). U. S. 2,185,140, Dec. 26. Examples with details are given of the production of blue dyes such as 4-*p*-chloro- and -bromo-benzoylaminoanthraquinone-6′-chlorobenzacridone, giving dyeings of good fastness to Cl, to boiling and to light.

Colored condensation products. Soc. pour l'ind. chim. à Bâle. Brit. 508,803, July 5, 1939. These are made by condensing a compd. of formula, $YXNCOCH_2CN$, where X is a C_6H_4 residue, which may contain substituents, and Y is H, an alkyl group or a hydroxyalkyl group, which may be etherified or esterified, with an aldehyde of formula, *p*-R′R″NC_6H_4CHO, in which R′ is an alkyl group and R″ an etherified or esterified hydroxyalkyl group, or with a benzylidene compd. of an aldehyde of said formula with an aromatic aminosulfonic acid. They are yellow to orange substances that dissolve in org. solvents, e. g., Me_2CO, AcOEt, to intensely yellow to greenish yellow solns. and may be used *for coloring lacquers* that are produced on a basis of natural or artificial resin, nitrocellulose, acetylcellulose, etc., and for coloring artificial materials, e. g., condensation products of phenols or urea and CH_2O; they are also especially suited for *dyeing cellulose esters* and *ethers*, particularly acetate rayon. Among examples, cyanoacetic acid anilide and (*N*-ethyl-*N*-methoxyethyl)-*p*-aminobenzaldehyde (obtainable by the methods of Ger. 103,578, 105,103 and 105,105) are dissolved in alc. and the soln., after addn. of a base, e. g., piperidine, an alkali or EtONa, is boiled under reflux; on cooling with stirring, the yellow condensate sepa. as a powder.

Base for ice colors. V. M. Rodionov, B. M. Bogoslovskiĭ and L. M. Tsil'man. Russ. 56,131, Nov. 30, 1939. A base for ice colors of the type of arylazo-1-naphthylamine is prepd. by the interaction of diazo compds. obtained from 2(or 4)-methoxy-5-nitroaniline and 1-naphthylamine.

Diazo derivatives of guanidylsulfonic acids. Hans Z. Lecher and Henry P. Orem (to American Cyanamid Co.). U. S. 2,185,152, Dec. 26. Numerous examples are given of the production of stabilized ice color diazo components of the general formula, $X—(N{=}N—G)_n$, in which X is a radical of an ice color diazo component, G is a satd. aliphatic and cycloaliphatic guanidylsulfonic acid radical or of their alkali metal and ammonium salts having at least 2 C atoms between the guanidine and the nearest sulfonic group, and *n* is 1 or 2. Such products are useful in the *printing of ice colors* with a coupling component in a stable alk. printing paste with subsequent development of the prints with weak acid or acid vapors. U. S. 2,185,153, relates to color-producing compns. including stabilized ice color diazo components of the character specified and admixed coupling components. U. S. 2,185,154 (Hans Z. Lecher, Henry P. Orem and Frederic H. Adams, joint inventors; to American Cyanamid Co.) relates to stabilized diazo compds. suitable for use as in the printing of ice colors and having the general formula, $5—X—2—YC_6H_3—N{=}N—G(—Q—Z_n)_m$, in which X and Y are radicals included in the group consisting of alkyl, alkoxy, aryloxy, nitro, halogen and CF_3 radicals, G is a guanidyl radical free from substituents capable of azoic coupling, Q is a radical incapable of azoic coupling and included in the group consisting of aromatic, aromatic-aliphatic, aliphatic and alicylic radicals, Z is a member of the group consisting of carboxylic acid radicals, sulfonic acid radicals and their alkali metal and NH_4 salts, and *n* is a whole number included in the group consisting of 1, 2 and 3 and *m* is a whole number included in the group consisting of 1 and 2.

Pastes of dyes of the dibenzanthrone class. Otto Stallmann (to E. I. du Pont de Nemours & Co.). U. S. 2,185,871, Jan. 2. A process for prepg. microcryst. dye pastes and powders of the alkylation derivs. of *Bz*-2,*Bz*-2′-dihydroxydibenzanthrone comprises converting a compd. of the class consisting of the normal leuco compd. of the color and its alkali metal salt to a stable reduction deriv. by heating in soln. or suspension at a temp. of from 55 to 100° while maintaining the suspension or soln. at a pH of 9–12 and reoxidizing the pptd. stable reduction deriv. to the parent ketonic form.

Textile printing inks. Ruwin Bronsztajn. U. S. 2,185,181, Jan. 2. With a vehicle such as water, there is used a powd. mixt. contg. a pigment such as ZnO, a hydrophilic gum such as gum tragacanth and a mixt. of thermally noncoagulable, sol. vegetable protein, and such a quantity of uncoagulated albumin as will be capable of rendering the whole mixt. heat-coagulable.

Black dyeings. Moses L. Crossley and Lawrence D. Lytle (to American Cyanamid Co.). U. S. 2,185,143, Dec. 26. Materials are dyed with a black vat dye of the dibenzanthrone series which is obtained by fusing with caustic alkali a dibenzanthrone compd. such as dinitrodibenzanthrone having a group capable of promoting condensation of dye mols. (the dye being fast to acetone solns. of cellulose acetate), and after dyeing the material is impregnated with a soln. of an org. plastic such as a cellulose acetate compn. to render it stiff and creaseproof.

Dyeing vegetable fibers. Fritz Straub, Walter Hanhart and Walter Anderau (to Soc. pour l'ind. chim. à Bâle). U. S. 2,185,905, Jan. 2. A process for the production of fast tints with use of complex metal compds. of direct cotton dyes involves at least one treatment of the material in a caustic alk. medium which is heated to not exceeding its b. p., and serves to give a better dyeing.

Improving the dyeing properties of cellulose textile fibers. Leon Lilienfeld. U. S. 2,185,795, Jan. 2. Fibers such as cotton or rayon are treated with at least one org. compd. (such as a reaction product of NH_3 on a dihalohydrin of glycerol) which contains an aliphatic chain of C atoms connected C to C and contg. halogen, O and N, each bonded to a different C atom in the chain (suitably in a 20–30% aq. soln. at 20°). Numerous examples are given.

Printing designs on textile fabrics. Walter Robinson, Joseph Westemeyer, Jr., and Charles A. Borloz. U. S. 2,186,176, Jan. 9. A process of printing designs on textile fabrics involves producing a master pattern comprising a plurality of distinct arbitrary figures in the colors embodied in the finished design and covering such master pattern with a monotone outline pattern for producing the ground coloration outlining the design to be produced leaving the differently colored arbitrary figures of the master pattern within the outline unaffected and the areas outside thereof obliterated, the arbitrary figures of the master pattern having no fitting relationship with the outline pattern.

Threads and fibers of highly polymerized materials such as afterchlorinated polymerized vinyl chloride, etc. Heinrich Jacqué (to I. G. Farbenind. A.-G.). U. S. 2,185,789, Jan. 2. A process of producing threads and fibers from highly polymerized org. materials comprises forming a thin film of the material and stretching it in the direction of its length sufficiently to produce an orientation of the mols. in the direction of length and to render the film capable of disintegration by friction into fibers, and frictionally working the film to disintegrate it into fibers.

Treating filaments, fibers, yarns, etc. Wm. I. Taylor and Leslie B. Gibbins. Brit. 508,968, July 7, 1939. Textile materials are crimped by deformation by applying lateral pressure locally thereto in the presence of an agent that softens the substance thereof, simultaneously rubbing

the materials in a direction transverse to the direction of application of the pressure and then removing the deformed material from the influence of the softening agent so as to set the deformation therein. App. is described. The process is particularly applicable to continuous filaments or staple fibers of cellulose acetate (I) or other thermoplastic cellulose deriv., e. g., esters such as the formate, propionate or butyrate or ethers such as Et or benzyl cellulose. A hot aq. medium, e. g., at 95–100°, or wet steam at atm. or superatm. pressure may be used as softening agent. The materials may be pretreated with a liquid adapted to facilitate softening, e. g., an aq. EtOH soln. for I.

Treating filaments, yarns, foils, etc. Henry Dreyfus, Robert W. Moncrieff and Frank B. Hill. Brit. 509,010, July 5, 1939. In treating filaments, etc., particularly those having a basis of an org. deriv. of cellulose, in order to improve their tenacity, with fluid media under pressure by a process wherein the material passes through a small orifice in a wall of substantially closed app. contg. a fluid, e. g., steam, under pressure, a substantial proportion of the medium is diverted from entering the orifice, e. g., by withdrawing the proportion before the remainder passes through the orifice to the atm., so that the flow of the fluid from the orifice will not exert an undesirable tension on the material.

Conditioning yarns such as those of cellulose acetate. Joseph B. Dickey and James G. McNally (to Eastman Kodak Co.). U. S. 2,184,008, Dec. 19. A process of conditioning yarn to render it more amenable to textile operations including knitting, weaving, spinning, etc., comprises applying thereto a lubricating and softening compn. contg. a carbamate having the general formula: $ROCONHR'$, where R is an alkyl or alkoxyalkyl group and R′ is an alkyl, the hydroxy- or alkoxy-substituted alkyl group. E. g., use may be made of β-ethoxyethyl *N*-propylcarbamate. U. S. 2,184,009 (Joseph B. Dickey and James B. Normington, joint inventors; to same assignee) relates to the like use of α-tetrahydrofurfuryloxy-β-ethoxyethoxyethyl ether or various other acetal ethers having the general formula $ROCH_2CH(OR')(OR'')$, where R is an alkyl, aryl, or substituted alkyl group, R′ is an alkyl, aryl or substituted alkyl group, and R″ is an alkyl group.

Crepe thread of cellulose acetate or the like. Wm. Whitehead (to Celanese Corp. of America). U. S. 2,186,056, Jan. 9. In production of highly twisted crepe thread of filaments such as those of cellulose acetate, a resin such as a polymerized methyl methacrylate compn. is incorporated in the thread and it is subjected to the action of a hot aq. fluid while undergoing crepe twisting.

Continuous production of cellulose acetate and other cut staple yarn or the like. Henry R. Childs (to Eastman Kodak Co.). U. S. 2,186,135, Jan. 9. App. is described and a continuous process of producing a uniform blend of cellulose org. deriv. cut staple fibers contg. a plurality of deniers of fibers all having crimped, kinky and woolly appearance and a resiliency and other phys. characteristics closely simulating natural wool, which comprises extruding in the form of filaments a cellulose org. deriv. dope contg. a crimping agent from the group consisting of high-boiling solvents, semi-solvents and plasticizers, through a plurality of spinnerettes, a given one of which is adapted to produce filaments of different denier from the others, removing solvent from the filaments, cutting them into staple lengths, drying the staple fibers to remove traces of residual solvent, treating the fibers first in a crimp-inducing bath composed of a cellulose deriv. nonsolvent from the group consisting of water, ethers and chlorinated hydrocarbons, while the fibers are in an open, heterogeneously disposed condition and then in an antistatic bath contg. an antistatic agent from the group consisting of the amine salts of sulfated aliphatic alcs. contg. at least 10 C atoms and the salts formed by the interaction of an org. base from the group consisting of the alkylamines, the substituted alkylamines, the alicyclic amines, the alkylolamines, and the amines contg. an ether linkage, with a compd. from the group consisting of the aromatic sulfonic acids, the org. acids contg. a cyclic ether residue and the org. acids contg. an open-chain ether residue, and thereafter drying the crimped staple product.

Crepe effects on fabrics containing cellulose acetate threads, etc. Cyril M. Croft (to Celanese Corp. of America). U. S. 2,185,627, Jan. 2. Fabrics contg. highly twisted yarns at least some of which contain org. derivs. of cellulose are introduced into a treating bath such as plain water at a temp. below 90° and the bath and fabric are then heated to near, but below, the b. p. of the bath.

Nitrogenous condensation products suitable for treating (as in "animalizing") vegetable fibers or rayon, etc. Heinrich Ulrich and Karlhugo Küspert (to I. G. Farbenind. A.-G.). U. S. 2,185,480, Jan. 2. By condensing an alkylenimine contg. at least one H atom attached to N, such as monomeric ethylenimine with an ester such as the sulfuric ester of an alc. contg. at least 6 C atoms in the mol., such as the Na salt of octodecenyl sulfuric acid ester, a product is obtained suitable for treating textiles.

Colored filaments, foils, etc., from viscose. Schlesische Zellwolle A.-G. Brit. 509,085, July 11, 1939. CS_2 is caused to act on alkali cellulose of the compn. generally used in the rayon and staple-fiber industries, e. g., contg. cellulose 30 and alkali 15%, in the presence of dyes that contain 1 or more free OH groups. Examples of dyes are Naphthol AS coupled with Fast Red 3GL base to give scarlet, Naphthol AS-E coupled with Variamine Blue Salt FG to give fast blue, Naphthol AS-SG coupled with Fast Red B-base to give fast black, Diazo Brilliant Green 3G as a diazotizing dye, Alizarin Fast Blue BHG and Diamond Black PV as chrome lacquer pigment dyes, Immedial pure blue, etc.

Treating textiles. Röhm & Haas Co. Brit. 509,079, July 11, 1939. A tertiary amine salt, e. g., dimethylcetylamine-HCl, or a quaternary NH_4 salt, e. g., dimethylbenzylcetylammonium chloride, sulfate or stearate, or dimethylphenylcetylammonium chloride, contg. at least 12 C atoms, is incorporated in the bath contg. artificial resin, e. g., a urea-CH_2O resin, used to finish a textile material, e. g., to render it more resistant to crushing or to produce a nonslip finish.

Treating textile fabrics such as those of regenerated cellulose to improve their texture. Karl Brodersen, Matthias Quaedvlieg, Max Zabel and Albert Schneider (to I. G. Farbenind. A.-G.). U. S. 2,185,427, Jan. 2. The fabrics are treated in a bath contg. a water-sol. salt of a polyhydroxyalkylated biguanide of an aliphatic base contg. at least 10 C atoms and formed with an org. carboxylic or org. sulfonic acid, such as the salicylate of polyhydroxyethylated stearyl biguanide.

Forming slivers of fibrous materials such as cellulose acetate rayon. Charles L. Norton. U. S. 2,185,417, Jan. 2. Various details of app. and operation.

Rayon, etc. Aktien-Gesellschaft für Vermögensverwertung. Brit. 508,840, June 26, 1939. Divided on 508,781 (*C. A.* **34**, 8874). Rayon, spun fibers, horsehair, bands, films, etc., are prepd. from solns. of soybean casein to which have been added carboxylic acids having at least 3 C atoms, e. g., propionic, stearic, heptylic, caprylic, capronic, and (or) their derivs., e. g., esters or amides, the soln. being spun or extruded. Aliphatic amines or amino acids may be added to the soln., NH_2Pr, allylamine or NH_2Bu being suitable. The spinning properties are also improved by small addns. of CS_2. Substances that form insol. compds. with 1 another and (or) with the casein by polymerization or condensation, e. g., phenolaldehyde, Me_2CO-aldehyde, polyvinyl, aldehyde-urea, ketone-urea and ketone-phenol types of resin, may be added. Acid or alk. catalysts may be added to accelerate the formation of said insol. compds. The casein soln. may be treated according to the dry-spinning process and the spinning channel charged with vapors of aldehyde, e. g., CH_2O, AcH, or alternatively or additionally with vapors of org. or inorg. acids. The AcH or phthalic acid anhydride may be hardened with glyoxal.

Finishing fabrics such as those containing wool and cellulose acetate. Herbert Platt (to Celanese Corp. of

America). U. S. 2,186,121, Jan. 9. A fabric having a "good hand" is obtained by wet-finishing operations followed by subjecting the material, contg. 1.2–2 times its wt. of moisture, to tenter-drying.

Apparatus for sizing and drying warp yarns. Ira L. Griffin. U. S. 2,185,747, Jan. 2. Various structural, mech. and operative details.

Size for yarns. William Whitehead (to Camille Dreyfus). Can. 387,173, Feb. 27, 1940. A size comprises gelatin 10–15 parts, a water-sol. boric acid ester of a water-sol. polyhydric alc. 0.5–2 parts, a sulfonated vegetable oil or a sulfonated higher alc. 1–3 parts, and sufficient water.

Desizing cellulose fabrics, etc. Stanley I. Garnett (to American Cyanamid Co.). U. S. 2,185,548, Jan. 2. In removing carbohydrate sizing, use is made of an aq. SO_2 soln. (suitably a 0.5% soln. at about 38°).

Textile-treating composition. Adolph Scholler, deceased (to Scholler Bros., Ltd.). Can. 387,153, Feb. 27, 1940. A delustering, waterproofing and finishing compn. for textiles operating in a single bath at dilns. of 50–300 vols. comprises an aq. dispersion of a wax 2–10, an insol. inorg. delustrant 1–8, $Al_2(SO_4)_2$ 0.5–5.0, gelatin 0.05–0.5, and tapioca 3–10%.

Sheening the pile of wool rugs. James D. MacMahon, Lorenzo D. Taylor and Varton M. Kalusdian (to Mathieson Alkali Works). U. S. 2,185,210, Jan. 2. The pile is subjected to treatment in an aq. caustic alkali soln. (suitably a 0.035% soln. of NaOH) of a concn. insufficient adversely to affect the pile, and is then treated with an aq. $Ca(OCl)_2$ soln. of a strength (suitably about 0.3% of Cl) insufficient to cause a substantial loss of tensile strength of the fiber and insufficient to alter the color of the pile.

Permanent glaze chintz. Denis De Goencz, Edmund C. Tarnuzzer and Alfred F. Stockwell (to Arnold Print Works). U. S. 2,185,746, Jan. 2. A method of producing glazed chintz comprises applying to the cloth a temporary filler, drying and calendering the filled cloth to a smooth, dense surface to limit penetration of a subsequently applied urea-CH_2O coating prepn., applying upon the smooth, dense surface thus provided a coating of aq. prepn. of an initial stage of a urea-CH_2O resin, drying the coating to a nontacky state, friction calendering the coated goods while the setting of the urea-CH_2O resin is in progress to obtain a highly glossy surface and to force the resin coating into firm contact with the filled cloth, further setting the urea-CH_2O resin to a substantially water-insol. state, after the friction-calendering operation, removing the temporary filler and breaking up the continuity of the urea-CH_2O resin coating. The temporary filler may be tapioca starch.

Coated and impregnated fabrics. Donald E. Edgar and Paul Robinson (to E. I. du Pont de Nemours & Co.). Can. 387,248, Mar. 5, 1940. A silk fabric is impregnated with a resin from urea, aldehyde and monohydric alc. and, as softening agent, blown castor oil or hydrogenerated castor oil phthalate. The fabric substantially retains its flexibility at low temps.

Compositions suitable for waterproofing fabrics. John B. Cleaveland. U. S. reissue 21,311, Jan. 2. A reissue of original patent No. 2,046,305 (*C. A.* **30**, 5816[5]).

Waterproof coatings on carpets, rugs, tent and awning fabrics, etc. David P. Moore. U. S. 2,185,217, Jan. 2. A process for coating flexible porous material involves feeding the material from a roll in stretched condition, distributing simultaneously and from 2 different sources a finely divided dehydrating and setting Ca compd. such as portland cement, plaster of Paris or CaO and an aq. dispersion of rubber, so as to produce a uniform adhering waterproof coating which will congeal into a nontacky condition before the material is wound on a take-up roll.

Mothproofing detergent compositions. Hermann Stötter and Theodor Hermann (to Winthrop Chemical Co.). U. S. 2,184,951, Dec. 26. A mothproofing detergent compn. is formed essentially of an acid soapy washing agent and triphenyldichlorobenzylphosphonium chloride, at most only slightly colored in the dry state, sol. in water, and suitable for treating wool, feathers, hair, etc., for simultaneous cleaning and mothproofing.

Fireproofing cellulose fibrous materials such as loose cotton fibers. Ralph R. Oliver (to Lockport Cotton Batting Co.). U. S. 2,185,695, Jan. 2. See Can. 383,902 (*C. A.* **33**, 9010[5]).

26—PAINTS, VARNISHES AND LACQUERS

A. H. SABIN AND CARLTON H. ROSE

Luminous paint. A. E. Lain and H. A. Collinson. *Pharm. J.* **143**, 427(1939).—The "black-out" conditions imposed by the war brought out this subject. Tech. principles of manuf. are discussed. To avoid "poisoning" the light effect, Pb, Cu and Fe must be kept out of the "undercoat." By exposure to a 100-watt elec. bulb for 30 min., a 13-hr. luminosity can be obtained.
S. Waldbott

Underwater paints for ships' hulls. Gerhard Schröder. *Farben-Chem.* **10**, 275–6, 283(1939).—A discussion of formulation of suitable paints for preventing corrosion and fouling.
J. W. Perry

Problems of protecting structures with paint. Hans Wagner. *Chem.-Ztg.* **64**, 57–9(1940).—W. discusses protective coatings for masonry and wood structures. Metallic soaps are considered, with or without the admixt. of fillers that are added to raw masonry materials before they are mixed together as protective agents; however, such protective admixts. are not classified as paints. Nor are gel protective coatings such as are formed by the double decompn. of the coating materials with the surface of the masonry considered as paints (aq. solns. of $ZnSO_4$ applied to stucco, concrete, etc.). A coating of water glass is considered as a paint, but its protective qualities are reduced by residual alkali that often causes efflorescence. A preliminary acid wash or application of Al salts soln. to form Al silicate lessens this danger, but does not prevent blooming. Silicofluoride coatings that react with the surface of masonry are considered as paints; however, masonry contractors are disinclined to use silicofluorides because of alleged failures. According to the author, these failures are due to faulty technique and to the great variation in the chem. compn. of com. silicofluorides, that are discussed in detail. Such colorless coatings as Carbolineum and clear varnish are also considered as paints. Colored and white enamel-like coatings for precast asbestos-portland-cement-, and Sorel- (magnesia) cement-sawdust slabs are also discussed. In referring to protective emulsions and solns. made from latex, bitumen, fatty acids esters, resins of the vinyl and acrylic acid groups, synthetic rubber, unsaponifiable waxes, mineral and drying oils, emphasis is placed on the necessity for providing ventilation through the pores of masonry. If the surface is hermetically sealed so that water, water vapor and salt solns. cannot find egress, then scaling, spalling occurs. Bitumens have the drawback of unsightliness, latex, of instability in the presence of alkalies. Synthetic rubber with Cl-content is very stable in contact with acids and alkalies. Urea-formaldehyde-condensates deserve much wider use for protecting wood surfaces because of cheapness and fire-retarding qualities. The same applies to the highly chlorinated hydrocarbons. Protective emulsions made from waste sulfite liquors, with or without asbestos and other fillers are also suggested as effective fire-retardant coatings.
A. W. King

The loss of drying power of black paints caused by aging. J. E. Rose and H. A. Bennett. *Paint, Oil Chem. Rev.* **101**, No. 23, 114–18(1939).—See *C. A.* **34**, 6424.
J. W. Perry

Loss of drying power in brown paints. Kansas City Paint & Varnish Production Club. *Paint, Oil Chem.*

Rev. **101**, No. 23, 52–4(1939).—See *C. A.* **34**, 6434. J. W. Perry

Primers for nonferrous metals. I. Golden Gate Paint & Varnish Production Club. Harry Eastwood, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 60–2(1939).—See *C. A.* **34**, 6448. J. W. Perry

Preventing dermatitis in the paint and varnish industry. H. Pfanner. *Farben-Chem.* **10**, 269–71(1939); *Farben-Ztg.* **44**, 1215–16(1939).—Tendencies toward dermatitis can be counteracted by avoiding washing the skin with alk. agents, e. g., soap, using instead one of the newer acidic washing agents. Such agents cleanse without changing the natural condition of the skin and thus rendering it susceptible to external influences. J. W. Perry

A study of the effect of pigment concentration on the hiding power of white pigments. Baltimore Paint & Varnish Production Club. E. B. Schuler, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 64–8(1939).—See *C. A.* **34**, 6446. J. W. Perry

Some aspects of the fading of colored pigments. I. Mackenzie-Richards. *Natl. Paint Bull.* **4**, 12–15(Feb., 1940).—The only really permanent compds. are those whose color depends on oxides of Fe or Cr or on Fe silicate. The fading power of the sun is proportional to its power to affect Ag halide. W. H. Boynton

Dispersion of pigments in aqueous medium. I. Mechanism and evaluation of dispersing agents. F. K. Daniel. *India Rubber World* **101**, No. 3, 50–2(1939).—The relations between wetting, dispersing and protective agents and the mechanisms of their actions are discussed, and known methods for testing degree of dispersion are described. **II. Induced dilatancy and its relation to dispersion.** *Ibid.* No. 4, 33–7(1940).—A new *method for detg. degree of dispersion*, which is based on dilatancy, is described. Dilatancy has been regarded as an inherent property of certain minerals and liquids, and no case has been reported heretofore where the addn. of a compd. in soln. induces dilatancy in a solid and liquid which otherwise does not show this phenomenon. A study of the relation between pigment concn. and dilatancy and flocculation indicated that flocculation, thixotropy, passive dilatancy and active dilatancy represent various stages of dispersion, with no sharp demarcation sepg. 1 stage from another. Close and loose packing (cf. Freundlich and Röder, *C. A.* **32**, 2806[8]) are not opposing conditions, but are the 2 limits of the entire range of dispersion, from complete flocculation to complete dispersion. All intermediate stages can be produced in all types of flocculated systems by the addn. of surface-active substances. This has been clearly understood before because the gradual transition of a substance from flocculation to active dilatancy has not been known before. Many pigments other than ZnO can be rendered actively dilatant, e. g., Sb_2O_3, white lead, toluidine toner, chrome yellow and chrome orange. Since active dilatancy represents the highest degree of dispersion, it can be used as a criterion of the effectiveness of a dispersing agent, although this is true only for comparing systems of commensurate particle size. Furthermore there may be agents which disperse a pigment fairly well without forming an actively or passively dilatant system. The same dispersing agent is not equally effective with all pigments, but in general dispersing agents which produce dilatancy have wider applicability than those which do not. The dilatancy test may be accepted as a rapid and convenient method of evaluating dispersions in all cases where dispersions of relatively high degrees are obtained. An inconsistency in the results of the sedimentation vol. and dilatancy tests on the one hand and the consistency test on the other hand is discussed. Systems contg. 1 of the dispersing agents showed no dilatancy and had relatively large sedimentation vols., yet they remained fluid at concns. higher than those attainable with dilatant systems. This discrepancy cannot be satisfactorily explained, but it is not believed to invalidate the conclusions already drawn regarding the relation between dilatancy and small vol. of sedimentation on the one hand and dispersion on the other hand. The mechanism of dilatancy is discussed. The difference in the dilatancy effects of 2 agents may depend largely on the magnitude of the ζ potential, and a high ζ potential is apparently the chief factor in forming actively dilatant systems, i. e., in preventing the attractive or adhesive forces between particles from becoming dominant (cf. Buzágh, *C. A.* **24**, 3938, 4684). In actively dilatant systems the repelling forces are so strong that a pattern with the particles equidistant is established, but this pattern can be reversibly upset by external forces, with the known mech. manifestations. Passively dilatant systems are partially flocculated or at least have a less oriented, rigid pattern and weaker repelling forces, as evidenced by the higher proportion of water to make a paste and by their thixotropy. Although mech. forces do not change the degree of dispersion of actively dilatant systems, reduction of the electrokinetic forces below a crit. value destroys the dilatancy immediately. Small percentages of electrolytes, i. e., discharging cations, change an actively dilatant system to a passively dilatant system, and larger percentages cause complete flocculation. Except for minor deviations, the coagulating effect of electrolytes on hydrophobic sols parallels their ability to decrease the cataphoretic velocity of the dispersed particles. Also the influence of electrolytes on flocculation is governed by the valency rule. The parallelism between the increase in adhesion between particles and in electrolyte concn. is fairly strict for all dispersions. Electrolytes do not act chemically but change the ζ potential of the particles on the solvation layers. Hence, irrespective of the effectiveness of a dispersing agent, salts and acids can nullify its effect. C. C. D.

Production of electrolytic white lead. J. F. Sacher. *Farben-Chem.* **10**, 125–6(1939).—Claims made by Dévai (*C. A.* **32**, 8948[3]) concerning the uniformity of electrolytic white Pb and its tech. advantages over chamber products are contested. B. C. P. A.

Developments in the dispersion of carbon black. L. J. Venuto. *Am. Paint J.* **24**, 68, 70–8(Mar. 11, 1940). Particle size, structure and volatile layer are closely related to the color, dispersing and other properties of C black. Factors influencing the dispersion are charted and comparisons tabulated of color and oil absorption of C black, obtained by the new and the old process. Properties of typical paint and ink blacks and ultimate analyses of typical blacks are also shown. Types of mills are discussed. Certain types of C black possess an active surface which allows rapid wetting and easy dispersion. The phys. condition of the black has a marked effect on its dispersion properties. The wetting characteristics of the vehicle are important in the speed of dispersion of C black and in the stability of the resulting product. Certain addn. agents and solvent mixt. have proved beneficial. Premixing and sweating help to reduce milling time. The combination of high viscosity, milling and certain sp. dispersing agents yields the highest com. degree of true colloidal dispersion with the accompanying brilliant blackness, gloss and other desirable properties. In ball and pebble milling, a careful balance between resin, black and solvent must be retained to secure efficient dispersion. W. H. Boynton

The manufacture of lithopone. Modern processing and patents. E. F. Mactaggart. *Ind. Chemist* **16**, 72–7 (1940).—A review. E. H.

Process inks. Elbert M. Ludlam. *Am. Ink Maker* **18**, No. 2, 25–7(1940).—Current development toward improving transparency and gloss of inks is discussed from the standpoint of "subtractive" and "additive" color reproduction. L. Wilson Greene

Ink consistency and its relation to printing problems. Andrew Voet. *Am. Ink Maker* **18**, No. 3, 20–3, 27 (1940). E. H.

The drying oils of the Aleurites. L. Adriaens. *Congo* **1**, 499–519(1938); *Chem. Zentr.* **1938, II**, 3480.—The oils of the varieties of *Aleurites* dry more rapidly than linseed oil although they have a lower apparent I no. This is due to the fact that the α- and β-elaeostearic acids, constituents of *Aleurite* oil, possess a system of 3 conjugated double bonds. It dries rapidly but reacts with the theoretical amt. of I only very slowly. Of the oils which

are obtained in the Belgian Congo, the following characteristic properties are reported: Oil from *Aleurites triloba:* d^{15} 0.9276, $n^{22.5}$ 1.4745, acid no. 33.1, sapon. no. 193.9, apparent I no. (Wijs) 159.1–162; two oils of *Aleurites cordata:* d^{15} 0.9378 and 0.9390, n^{45} 1.5180 and $n^{20.5}$ 1.4989, acid no. 2.0 and 1.42, sapon. no. 201.6 and 189.0, apparent I no. (Wijs) 167.0–71 and 162.9, true I no. for the 2nd oil (Wijs) 196.0; 2 oils from *Aleurites montana* d^{15} 0.9402 and 0.9275; $n^{20.5}$ 1.4983 and n^{20} 1.4761, acid no. 0.92 and 1.69; sapon. no. 196.86 and 199.0, apparent I no. (Wijs) 170.8 and 143.7–51.5, true I no. (Wijs) 196.0 and 158.8. Varieties of *Aleurites* acclimated in Belgian Congo yield oils with the properties of wood and tung oils. The oils from *Aleurites montana* contain 1 or 2 eleostearic acids. M. G. Moore

The use of nondrying and semidrying oils in paint and lacquer industry. N. A. Suvorovskaya. *Org. Chem. Ind.* (U. S. S. R.) **6**, 227–31(1939).—Several formulas are given for the prepn. of drying oils from cottonseed, corn, sunflower and seal oils and from Glyptal resins combined with semidrying oils and treated castor oil. The best results in cold drying are obtained with lacquers prepd. from Glyptal resin and castor oil at 280°. Glyptal lacquers with semidrying oils give satisfactory films by hot drying. Oxidized and dehydrated semidrying oils are suited for black lacquers. Chas. Blanc

Dehydrated castor oil. Paul W. Greubel. *Am. Ink Maker* **18**, No. 2, 20–1(1940); cf. Bogatyrev, Dridze and Kuzyuberdin, *C. A.* **33**, 8846.—The chemistry of castor oil is reviewed and the production of the dehydrated product and its use in lithographic varnishes are discussed. The prepn. of the so-called "synthetic tung oil" in Switzerland by dehydrating castor oil is briefly described. L. Wilson Greene

Can oil-free binders prevent corrosion? H. Heilberling. *Oberflächentech.* **17**, 17–18(1940).—The so-called "classical" binders for paints, viz., linseed oil and wood oil, owe their importance exclusively to their ability to form with certain basic pigments the so-called "metal soaps" which prevent the natural deterioration of the film and besides give it a considerable chem. and mech. resistance. Substitutes are investigated. Most of the substitutes have a higher acidity than linseed oil, e. g., alkyd and phenol resins, and this might give rise to changes in the film which in time attack the iron. Phenols, although only weakly acid, are not much more reliable in this respect. A basic ground coating is absolutely necessary, and lead white "Z" and the basic zinc oxides should always be employed if such substitutes have to be used. Red lead is then necessary as a priming coat. Six references. M. Hartenheim

Solvents for nitrocellulose. I. Determination of the rate of solution. A. Kraus. *Farben-Chem.* **10**, 236–7, 242, 301–4(1939).—Rate of soln. of nitrocellulose (I) is best detd. by vertically suspending a 5 × 50 mm. strip 0.1 mm. thick in such a way that a 1-cm. portion of the film is below the surface of the solvent under test and then observing the time elapsing before the submerged segment breaks away. Test with motion-picture film base and films of I prepd. without plasticizer gave the same relative order of rate of soln. with 22 org. solvents belonging to the alc., ester or ketone class. Lesser rapidity of soln. in a solvent was assocd. with greater viscosity of a 15% soln. of I therein, but there was no correlation with ability to tolerate addn. of nonsolvent diluents, e. g., toluene or naphtha. Comparative tests with 2 varieties of I, sol. (*A*) in esters and (*B*) in alc., showed similarities in comparative soln. rates with highly polar solvents, e. g., Et_2CO_3 or ethylene glycol derivs.; with the less strongly polar esters of carboxy acids with monohydric alcs., e. g., Bu propionate, the dissolving power became greater for *A* than for *B* as the no. of carbon atoms in the solvent mol. increased, i. e., as the polarity decreased. Detns. of rates of soln. with mixts. of solvents and nonsolvents showed (1) that the different nonsolvents, as a rule, decrease the rate of soln. to a different degree and (2) that for certain solvent-nonsolvent combinations the rate of soln. may actually be increased by limited proportions of nonsolvents. This effect is not general; it cannot be predicted whether it will be observed with any particular solvent-nonsolvent combination. With highly polar solvents, e. g., Et lactate, addn. of even hexane or octane (amt. 20%) increased the rate of soln. and decreased the viscosity of a 3.2% soln. of I. Practical use may be made of these phenomena in formulating lacquers having a min. tendency to lift previously applied lacquer films. II. **Increased solvent power due to water.** *Farben-Ztg.* **44**, 1031–2, 1052(1939).—The soln. rate was increased by addn. of water (0.5–1% or satn. amt.) to various org. solvents, such as esters, ketones and glycol derivs. and to a 40–60 alc.-ether mixt. Such addn. of limited amts. of water also decreased the viscosity and minimized the turbidity of solns. of I. With increased amts. of water, e. g., 10%, in alc.-ether solns. contg. 10% of I, the solns. tended toward return of turbidity and of the original higher viscosities observed with anhyd. solvent. Addns. of even small amts. of water to HCO_2H or AcOH diminished their solvent power for I, while with propionic and butyric acid, rate of soln. for I first increased (10% water) and then decreased again (15–25% water). J. W. P.

The new conception of petroleum solvents and thinners. Edward M. Toby, Jr. *Am. Paint J.* **24**, 15–16, 18, 21–2, 24, 26–8(1940).—A review. W. H. Boynton

Varnish kettles from the manufacturer's viewpoint. Alvin Hock. *Paint Ind. Mag.* **55**, 92–3, 94–5(1940); *Paint Oil Chem. Rev.* **102**, No. 5, 28, 30–2.—A general classification. Al and 18-8 stainless steel kettles are more corrosion-resistant than Cu, Ni or nichrome kettles. Stainless steel kettles lack the heat-transfer properties, to an extent, possessed by Cu or monel kettles. The properties, advantages and disadvantages of the various metals are tabulated. W. H. Boynton

Spirit varnishes. F. von Artus. *Farben-Chem.* **10**, 131–2, 137(1939).—A review of products consisting mainly of resins dissolved in alc. J. W. Perry

Varnish losses in weight and in volume. Chicago Paint & Varnish Production Club. R. J. Gnaedinger, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 69–72(1939).—See *C. A.* **34**, 6473. J. W. Perry

"Viscosity reduction method" for commercial evaluation of hydrocarbon solvents for synthetic varnish resins. Los Angeles Paint & Varnish Production Club. Ralph H. Huff, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 90–4, 96–8(1939).—See *C. A.* **34**, 6476. J. W. Perry

Effect of resins on kauri reduction. Louisville Paint & Varnish Production Club. A. E. Rheineck, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 78–80(1939).—See *C. A.* **34**, 6482. J. W. Perry

A study of natural resins in combination with synthetic resins for floor varnishes. New England Paint & Varnish Production Club. B. H. Kropel, *et al. Paint, Oil Chem. Rev.* **101**, No. 23, 80–9(1939).—See *C. A.* **34**, 6474. J. W. Perry

Studies of alkyl-phenolic resin lacquers with special reference to their technical properties. C. Dold. *Eidgenöss. Materialprüfungs- u. Versuchsanstalt Ind., Bauw. Gewerbe, Zürich, Ber.* No. **113**, 30 pp.(1938).—The exothermic reaction involved in the prepn. of lacquers by heating alkyl-phenolic resins with drying oils was studied. According to Hönel (Brit. pat. 334,572, *C. A.* **25**, 1110), this reaction comprises not only (*a*) further condensation of the resin mols., but (*b*) interaction of the resin and the drying oil esters. From the results summarized below, as well as the temp. curves of the reaction and the heats of combustion of the resin, oil and lacquer, D. concludes that (*a*) only is involved. The *viscosities* of the lacquers prepd. by heating 20% of reactive alkyl-phenolic resin (I) and modified phenolic resin (II) with linseed oil were, resp., 22.3 and 4 times that of linseed oil similarly treated. When a mixt. of 6 g. I and 20 g. paraffin, linseed or wood oil was heated under standard conditions in a current of dry N_2, the amt. of H_2O evolved was the same in each case.

The viscosity, drying power, hardness to scratching, and resistance to gas of lacquers prepd. from several phenolic resins are tabulated. The *tensile strength* and *load-elongation curves* of films prepd. from I and II were similar. Films prepd. from I have a higher weathering resistance than those from II. M. M. Flannery

Why does a nitrocellulose lacquer raise an artificial resin priming coat? Gerhard Schröder. *Farben-Chem.* 10, 161–3(1939).—If the priming coat on a metal surface is not merely softened but also swollen by the active solvents in the finishing coat of nitrocellulose lacquer, then danger exists that the priming coat may be raised with resultant permanent unevenness. Since this kind of trouble is encountered most frequently with primers formulated with large proportions of drying oils or O_2-convertible alkyds, it is recommended that primers be formulated with film-forming materials, e. g., polyvinyl resins, which are not O_2 convertible. J. W. Perry

Protective lacquers on aluminum foil. E. Erbacher and H. Haug. *Farbe u. Lack* 125–6(1939).—The testing of lacquers for Al foil which is used for wrapping cheese, etc., is outlined. B. C. P. A.

The measurement of adhesion of dried coatings. New York Paint & Varnish Production Club. Robert J. Moore, *et al. Paint, Oil Chem. Rev.* 101, No. 23, 102–13 (1939).—See *C. A.* 34, 6469. J. W. Perry

The new zinc resinates, including their use with tung-oil substitutes. Edwin Edelstein. *Paint Ind. Mag.* 55, 90–2(1940); *Paint Oil Chem. Rev.* 102, No. 6, 9–11; cf. *C. A.* 34, 2622⁸.—Research has permitted the production of Zn resinates having a high Zn content, higher m. p., lower acid no. and paler color than was possible previously. Zn resinate has been successfully incorporated into oiticica oil varnishes. Zn resinate apparently affects each paint and varnish in about the same manner, regardless of the oil or combinations used. Conclusions: (1) Zn resinates are an aid to thorough drying, particularly in conjunction with synthetic resins and ester gum; (2) they promote wetting and dispersion of pigment; (3) they help to improve the gloss and adhesion of a film; (4) they help to eliminate skinning and wrinkling; (5) they are excellent dispersing agents for oil gels and therefore make it possible to cook the drying oils in new ways; (6) when used with the usual drier combinations they inhibit loss of drying strength; (7) owing to the relatively high m. ps. of the Zitro and Zirex resin they exert an immediate hardening effect which is followed by thorough drying due to the Zn. A Zn resinate (Zirex resin) serves as a good constituent of exterior varnishes and enamels. W. H. Boynton

Three case studies in inert gas application. Harry W. Smith, Jr. *Gas* 16, No. 3, 24–7(Mar., 1940); *Gas. J.* 229, 304(1940).—Three *paint* factories use inert gas, produced by the combustion of natural gas in special generators, throughout the plant for stirring varnish kettles, especially where synthetic resins are used, and for protective atms. over storage tanks. This is much cheaper than the previously used bottled or solid CO_2. Provision will also be made to use this inert gas for extinguishing fires. R. W. Ryan

National Paint Dictionary. New York: Chemical Publishing Co. $5.00.

Drying paint with special radiations. Frederick J. Groven (to Ford Motor Co.). U. S. 2,186,067, Jan. 9. Drying is effected with use of radiations (in part direct and in part reflected) of a wave length between 0.6 and 1.6 microns, such as may be produced by use of a carbon 2 filament lamp bulb with a reflecting surface of Au or other suitable metal.

Pigments. Joseph E. Plumstead (to Raffold Process Corp.). U. S. 2,186,040, Jan. 9. A process of prepg. a pigment product comprises treating particles of alk. earth metal carbonate such as $CaCO_3$ in the presence of water with a reactive, inorg. substantially water-sol. compd. having a sulfite radical, partially to dissolve the carbonate particles to form particles with corroded surfaces, 3 and subsequently pptg. alk. earth metal sulfite on the corroded particles.

Separation of fine and coarse pigment particles. James E. Booge and Charles F. Oppermann (to E. I. du Pont de Nemours & Co.). U. S. 2,186,095, Jan. 9. In sepg. finely divided ZnS-contg. pigment particles in aq. suspension from coarser particles by wet grinding, a small amt. of an alkali metal pyrophosphate is added.

Compressed metal powder aggregates suitable for use as pigments. Clarence P. Harris. U. S. 2,185,194, Jan. 2. A substantially dustless solid or plastic aggregate is formed by mixing a metal powder such as a bronze powder with 0.5–10% its wt. of a binding liquid such as a petroleum fraction and subjecting the mixt. to a pressure of 1000 to 10,000 lb. per sq. in. without destroying the leafing power of the powder.

Titanium pigments. Sandford S. Cole (to National 5 Lead Co.). U. S. 2,184,938, Dec. 26. A method of prepg. thermally stable solid solns. of TiO_2 in Zn orthotitanate involves heating a mixt. of ZnO or a compd. yielding ZnO on heating or Zn orthotitanate or a solid soln. of TiO_2 in Zn orthotitanate unsatd. with respect to TiO_2, and TiO_2, hydrous Ti oxide or a Ti compd. yielding TiO_2 on heating, in proportions supplying less than 2 mols. ZnO for each mol of TiO_2, and an inorg. phosphate such as K_3PO_4 or H_3PO_4 proportioned to supply P_2O_5 6 0.05–5% based on the TiO_2 content of the mixt., at temps. of 450–1100°.

Red oxide of iron. Peter Fireman (to Magnetic Pigment Co.). U. S. 2,184,738, Dec. 26. App. is described, and a method of producing a red oxide of Fe of fine texture and purity from com. copperas which comprises maintaining an uninterrupted flow of finely divided copperas from a source of supply and subjecting the finely 7 divided copperas during transit to drying at regulated temp. sufficiently low that at no stage of the drying operation is the material being treated melted in its water of crystn. and is continuously maintained in its finely divided state, to remove from the copperas 6 of its 7 mols. of water, then transferring the resulting finely divided product to a rotating calcining zone and subjecting it during passage through the zone to heating gases at a 8 regulated temp. sufficiently high to produce Fe_2O_3 maintaining a bed of material being calcined during calcination in the zone, and rotating the calcining zone at such rate that the material is mixed with the bed and is only momentarily exposed to the heated gases so that overheating is avoided, whereby Fe_2O_3 of a fineness suitable *for pigment purposes*, without grinding, is obtained.

Removing lead acetate from white lead. B. D. Sholomovich. Russ. 55,833, Oct. 31, 1939. The washing off 9 of lead acetate from white lead is accelerated and losses of the pigment are reduced by mixing with oil before washing.

Lithographic printing inks. Interchemical Corp.[6] Brit. 508,917, July 7, 1939. A vehicle for such inks comprises a resin binder and a solvent consisting essentially of paraffin hydrocarbons that are substantially nonvolatile at ordinary room temps. The solvent may comprise a paraffin hydrocarbon cut of a petroleum hydrocarbon, the cut

having a Me_2SO_4 value below 5, preferably below 1. A plasticizer for the resin, e. g., a vegetable or animal oil such as peanut, linseed, soybean, corn or fish oil or an ester such as Me abietate, tritolyl phosphate, for the resin may be included; or plastic synthetic resins, e. g., oil-modified alkyds, may be used. The ink comprises a dispersion of pigment in the vehicle. An object is printed with the ink which is then dried by exposure to a high temp. for a predetd. time to volatilize the solvent. Cf. *C. A.* **33**, 2354[8].

Increasing the drying properties of weak drying and semidrying oils. Robert S. McKinney (to the People of the U. S. A. for free use). U. S. 2,185,414, Jan. 2. Oils such as soybean oil, cottonseed oil or corn oil are heated to 200–250° for 2–18 hrs. with about 0.1% of an alk. hydroxide such as $Ca(OH)_2$ or a salt such as Ca linolenate.

Emulsifiable substitute resin oil. Arthur Lazar (to Tide Water Associated Oil Co.). U. S. 2,186,248, Jan. 9. An oil suitable for use in lacquers, etc., comprises unsatd. and aromatic hydrocarbons derived from the treatment of a petroleum fraction contg. org. acids and heavier than kerosene by distg. off in the presence of an alkali about 80–90% of the liquid SO_2-sol. portion of such fraction, the residual oil contg. in soln. sufficient alkali metal soaps of the acids to render it readily emulsifiable alone with water and being sol. in mineral oil without the addn. of solvency-promoting agents because of the presence in the residual oil of products of reaction from the distn.

Varnish for rubber footwear. A. A. Aleksandrov, P. I. Nazarov, A. V. Panova, N. L. Eidel'nant and N. P. Protopopov. Russ. 56,121, Nov. 30, 1939. A mixt. of oxidized or polymerized fat or oil with tar and S dissolved in turpentine, white spirit or other solvents (S 10–25% of the wt. of oil or fat) is boiled down to a varnish.

Coating articles with nitrocellulose material. Elvin M. Bright (to John M. Wallace). Can. 387,022, Feb. 20, 1940. Nitrocellulose material dissolved in a solvent composed of acetone 60, isopropyl acetate 25, and anhyd. isopropyl alc. 15% is applied to an article to be coated, and the coating is treated in cycles, each cycle including the rapid withdrawal of the solvent for a short time by dipping the article into gasoline, and surrounding the article by air contg. solvent fumes, to effect shrinking of the nitrocellulose material. An app. is described.

Finishing composition. Thomas McCreery (to E. I. du Pont de Nemours and Co.). Can. 386,975, Feb. 20, 1940. About 62 parts of carnauba wax is dispersed in 55 parts of heat-bodied linseed oil by stirring at about 600°F., cooled to about 150°F., and about 223 parts of mineral spirits, b. 150–215°C., added.

Apparatus for applying enamel to wire by immersion. David S. Starring and Geo. B. Horn (to Wheeler Insulated Wire Co.). U. S. 2,184,704, Dec. 26. Various structural, mech. and operative details.

Linoxin-like material suitable for coating burlap, etc. Remmet Priester (to Koninklijke Industrieele Maatschappij v. h. Noury & van der Lande). U. S. 2,185,967, Jan. 2. A product similar to linoxin is produced by blowing with air an oil having drying properties which greatly increase the viscosity of the oil, and then treating it with an atm. of a strong nonoxidizing O-contg. acid such as H_2SO_4 or H_3PO_4 not substantially over 2% and allowing the material to stand until it is converted into a jelly-like mass.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Tenth Meeting of the International Commission for the Study of Fatty Materials. Anon. *Olii minerali, grassi e saponi, colori e vernici* **19**, 150–3(1939).—A report of exptl. work done to develop better standard methods for detg. oils in oil-bearing seeds, volatile sol. and insol. fatty acids in food fats, and for analyzing soap for resin, free alky. and total fatty acids. J. W. Perry

Collaborate studies of the D(eutsche) G(esellschaft für) F(ettforschung). VIII. Program of the Ninth Congress of the International Commission for the Study of Fats. Rome, 1938. General analytical methods. Anon. *Fette u. Seifen* **45**, 232–8(1938).—Improved variations of methods for detg. (1) polybromide value, (2) OH no. and (3) hydroxy fatty acids are given (cf. *C. A.* **32**, 4811[9]; **33**, 5211[3]). Definition of unsaponifiable matter and its detn. are discussed briefly. J. W. Perry

Recent work of the Royal Experiment Station for the Oil and Fat Industry of Milan (Italy) in the field of prevention of waste. G. B. Martinenghi. *Olii minerali, grassi e saponi, colori e vernici* **19**, 100–3(1939).—The recent development in Italy of the extn. of neat's foot oil and recovery of accompanying slaughter house by-products is discussed. Recovery of by-products from Dum palm kernel residues is reviewed (cf. *C. A.* **33**, 5212[4]). Possibilities of working up into valuable products, *tars obtained by carbonization of lignite* are pointed out. Dissatisfaction is expressed with Italian progress in the field of extn. of oil from oil seeds. J. W. Perry

Establishing objective standards for evaluating the color of fats. I. Volk. *Myasnaya Ind. S. S. S. R.* **9**, No. 9, 27–30(1938); *Chimie & industrie* **42**, 328.—The color of fats is governed essentially by the presence of carotene. Its intensity is a function of numerous other factors: origin, method of production, amt. of dissolved impurities, etc. The simplest method of evaluating the color is to compare it with that of a standard fat of good quality. To obtain objective values, these should be measured in a Lovibond colorimeter. A. Papineau-Couture

Recovery of fats from waste water. W. Passavant. *Fette u. Seifen* **46**, 583–5(1939).—The latest types of fat traps are discussed with drawings. J. W. Perry

The chemistry of the spoiling of fats. VII. The effect of heating on the keeping qualities of fats. J. Köchling and K. Täufel. *Fette u. Seifen* **46**, 206–9(1939); cf. *C. A.* **33**, 4445[9].—The effect of heating fats to various temps. or for varying periods on the rate of peroxide (Lea method, *C. A.* **33**, 1527[1]) formation during subsequent storage was studied. The peroxide content, both before and after storage for periods up to 60 days, increased on raising the temp. from 50° to 150° (20-min. heating period) and then decreased somewhat on going from 150° to 250° although never decreasing to the value of the unheated fat samples. These relationships hold for samples heated in the presence of air or of N_2, although the samples heated in presence of air showed much greater tendency to peroxide formation than those heated under N_2. On increasing the period of heating from 0.5 to 4 hrs., at 95° and 150° (the only temps. so investigated), peroxide formation during subsequent storage was accelerated. Rate of peroxide formation during storage depends on (1) initial peroxide content and (2) natural inhibitol content. Evidently, heating up to 150° increased peroxide content, while above 150° inhibitol content was reduced and peroxide formation was less than at 150°. Addn. of various samples of heated fats to unheated fats (3 cc. per 15 cc.) increased peroxide content after storage 42 days. J. W. Perry

Commercial filtration of animal fats. A. Sokolov and F. Yur'ev. *Myasnaya Ind. S. S. S. R.* **9**, No. 12, 9–15 (1938); *Chimie & industrie* **42**, 866.—The capacity of the filter press depends essentially on the temp. of the fat, increasing with the temp. The possible effect of temp. on the quality of the fat should be taken into consideration. The efficiency of the filter press can be increased by first passing through it the upper layers of the fat, which are less contaminated. A. Papineau-Couture

The use of fatty acid ester distillation methods in fat analysis. Herbert E. Longenecker. *Oil & Soap* **17**, 53–7 (1940).—This is a review of fractional distn. methods used in fat analysis. 63 references. E. Scherubel

Working up animal cadavers with attention to the process of the Gesellschaft zur Verwertung Fauth'scher Patente m. b. H., Wiesbaden. A. Friedsam. *Fette u. Seifen* 46, 586–7(1939).—According to the best modern practice, the cadavers are first cut up into small pieces, boiled with a NaCl soln. at 130° (under pressure), the fat sepd. off, the NaCl soln. drawn off for reuse and the slurry of bones and flesh dried for *feed for animals*. J. W. Perry

Discussion of the determination of glycerol in fats and oils. L. B. Smith and H. Matthews. *Oil & Soap* 17, 58–61(1940).—The results of the study of a dichromate method for detg. glycerol resulting from the sapon. of oils and fats are given. The method is given in detail; and the results appear to indicate that the method is capable of giving reliable results in the hands of the av. analyst; the av. difference between the calcd. glycerol and that detd. by the method was 0.12%. E. Scherubel

Linoleic acid content of seed fats and the isomerism of linoleic acid. J. P. Kass, W. Q. Lundberg and G. O. Burr. *Oil & Soap* 17, 50–3(1940).—The linoleic acid content of a series of seed fats was detd. by the thiocyanometric and the tetrabromide pptn. methods in a search for isomeric linoleic acids. The results indicated the presence of only one form of linoleic acid. The tetrabromide no. was shown to be affected by the pronounced soly. of α-tetrabromostearic acid in the other bromides and in the solid acids, its detn. therefore being of limited value. The thiocyanogen nos. of pure linoleic and linolenic acids were found to be empirical values differing markedly from the theoretical consts.; they require a revision of the accepted equations for the calcn. of the percentage concn. of the unsatd. acids in oils and mixed fat acids. Results are tabulated. E. Scherubel

Arylation of oils and fats. III. Synthesis of tolylstearic acid, methyl tolylstearate and the *p*-xenylamide of tolylstearic acid. W. Kimura and J. Turugi. *J. Soc. Chem. Ind., Japan* 42, Suppl. binding 390–1(1939)(in German); cf. *C. A.* 33, 8591[5].—Camelia oil (Wijs I no. 82.70) was tolylated under the optimum conditions listed previously, yielding a product (I) having: I no. 9.92; acid no. 7.36; ester no. 152.8; sapon. no. 160.16; and n_D^{30} 1.4700. After 2 fractional distns. of the Me esters of the fatty acids from I, about half of the material distg. under 3 mm. consisted of Me tolylstearate (II), a slightly yellow liquid, b_3 232–245°, n_D^{30} 1.4751–1.4781, d^{30} 0.9153–0.9167 and η^{30} (centipoises) 26.8–26.68; the other portion consisted of Me esters of sapon. no. 143.1–181.0, one fraction of which was solid. The tolylstearic acid (III), from II, had: n_D^{30} 1.4847–1.4879, d^{30} 0.9315–0.9324 and η^{30} (poises) 2.227–2.809. Since III gives one *p*-xenylamide, m. 86.5°, as the main product, and another *p*-xenylamide, m. 79°, in small quantities, III is probably a mixt. of isomeric tolylstearic acids. George Ayers

Titer of rosin fat acid mixtures. W. D. Pohle. *Soap* 16, No. 3, 61(1940).—Titer tests were made on 3 fat acids, stearic, lauric and oleic and on mixts. contg. 3 parts of one of these acids and one part of resin acid. The titer of rosin cannot be detd. since there is no break in the time-temp. curve when rosin passes from the liquid to the solid state. From the data it is evident that the calcn. of an equiv. titer for rosin is impossible, since the change in titer of a given fat acid by the addn. of a second component is not a function of the titer of the second component. At present the application of the titer test to fat acid-rosin mixts. appears to be limited to mixts. for which the relation between the titer test and the factory results have previously been detd. E. Scherubel

The detection of fat acids containing an even or odd number of carbon atoms and the analysis of cocoanut oil. E. Jantzen and H. Witgert. *Fette u. Seifen* 46, 563–9 (1939).—Preliminary expts. showed that distn. of the Me esters at 10 mm. pressure is the most practical method for sepn. of mixts. of satd. fat acids: Five careful fractionations of approx. 24 kg. of Me ester of cocoanut oil acid, with recovery of 97% of the starting material, resulted in isolation of the C_9, C_{11} and C_{13} odd fat acids. However, at least 99.5% of the acids of cocoanut oil had an even no. of C atoms. The m. ps. of very carefully purified fat acids were: C_8 16.5°; C_{10} 31.5°; C_{12} 43.9–44.0°; C_{14} 54.0–54.1°; the m. ps. and points of loss of transparency of crystals for very pure odd fat acids were C_9 12.5°, 1.5°; C_{11} 28.5°, 12.0°; C_{13} 41.5°, 28.0°. J. W. Perry

The distribution of the fat acids in halibut intestinal oil, with a note on the presence of free fat acids in the intestines of fish. John A. Lovern and Richard A. Morton. *Biochem. J.* 33, 1734–9(1939); cf. *C. A.* 33, 6627[4].—Halibut intestines were extd. with ether and the resulting oil was partially sepd. into its components. The products sepd. included free fat acids, phosphatides, vitamin and cholesterol esters and a neutralized oil. The fat acids were quantitatively analyzed and it was shown that both vitamin A and cholesterol were esterified with all the various acids present and that the amt. of the different esters present was proportional to the amts. of the acids present in the main fatty ext. The fat acids of the phosphatides were appreciably different from those of the main fat fraction and for this reason it seems likely that the phosphatide was not directly concerned in fat absorption. Even when the utmost speed was used in obtaining the intestines and extg. the fat from them, the oil contained more than 5% free fat acids and it seemed very probable that this amt. was present in the living fish. E. W. Scott

The Hanus method for determining the iodine number of olive oil. B. Frenguelli and R. Travaglini. *Olii minerali, grassi e saponi, colori e vernici* 19, 162–4(1939).—Tabulated data of the I nos. of 11 different Italian olive oils show excellent agreement between the Hübl and the Hanus method, when allowing 15 min. for the halogenation reaction of the oil sample with the latter method. If this period were extended to 1 hr. the agreement with the Hübl method was impaired somewhat. Adoption of the Hanus method as official is urged because of the ease of prepg. and storing the solns. used and the ease and rapidity of the detn. itself. J. W. Perry

Determination of some constants of iodated oils. M. Herold and M. Mastný. *Časopis Českého Lékárnictva* 19, 215–18(1939).—The oils taken into consideration are those which contain a high amt. of I (20–40%). The sample is weighed into a Ni crucible, several small pieces of KOH are added and followed by the addn. of 1 cc. of distd. water. The contents are mixed by gently rotating, then dried in an oven at 105° until free from water. The oil is then evapd. and ignited after several crystals of KNO_3 are added. The cooled substance is dissolved in hot water and transfered to a volumetric flask. An aliquot part is then taken and I detd. by titration according to the Volhard method. It was found that there is a dependence between sp. gr. of iodated oils and the contents of I. Tables were accordingly drawn up showing the relation between sp. gr. and the I content for certain oils so that the I content could be detd. from the sp. gr. of the iodated oil. V. D. Karpenko

Hydrogenation of vegetable oils. IV. Conjugated hydrogenation of sunflower oil with alcohols. V. A. Rush and I. L. Dvinyaninova. *J. Applied Chem.* (U. S. S. R.) 12, 1060–63(in French, 1064)(1939); cf. *C. A.* 33, 6629[1,4].—Sunflower oil contg. oleic acid 30.3, linoleic acid 61.4 and satd. acids 8.6% was hydrogenated in the presence of Ni catalyst ("Steol") by means of MeOH, EtOH, PrOH, iso-BuOH and iso-AmOH. The products contained, resp., oleic acid 57.6, 51.4, 54.6, 56.6 and 53.6; isoöleic acid 20.4, 26.6, 26.8, 16.6 and 26.4; satd. acids 10.6, 14.8, 13.4, 12.7 and 12.9; and linoleic acids 11.4, 7.2, 5.2, 14.1 and 7.1%. Thus the products approximated olive oil in compn. The yields of aldehydes formed from the respective alcs. were 16.7, —, 23.0, 33.9 and 60.2%; 5.1, —, 13.7, 3.6 and 10.9% of the aldehydes, resp., were decompd. and the rest was not accounted for. The hydrogenation of oil in the presence of iso-PrOH yielded a product contg. satd. acid 11.1, oleic acid 60.5, isoöleic acid 16.5 and linoleic acid 11.9%. In this case the yield of acetone was 72.5%, the decompn. of acetone amounted to 0.9% and the rest was unaccounted for. A. A. Podgorny

Detecting paraffin oil in oil of almond. Scipione Anselmi. *Olii minerali, grassi e saponi, colori e minerali* 19,

103–8(1939).—After tabulating data on the consts. of oil of almond (I), methods of detecting adulteration with paraffin oil (II) are reviewed. Attempts at detecting small proportions of II in I by saponifying in alc. soln. and dilg. with water so as to observe turbidity due to II were not very successful because soap tends to ppt. when the diln. is carried out at temps. sufficiently low to obtain turbidity in the presence of II. Much better results were obtained by dilg. with alc. contg. varying amts. of water. 2 The recommended method saponifies a 10-cc. oil sample by heating on a steam bath with 15 cc. of a KOH soln. (prepd. by dissolving 150 g. KOH in 100 cc. water and dilg. to 1 l. with 95% alc.) until sapon. is complete as indicated by a clear soln. After cooling to room temp., the soap soln. is dild. gradually with 70% alc. If 250 cc. of the latter can be added without appearance of turbidity at any time, the sample of I is not adulterated with II. The proportion of II present in adulterated I dets. the amt. of 3 70% alc. required for appearance of turbidity; this varies, e. g., from 200 cc. for 1% II to 135, 70, 23, 3 cc. for 2%, 4%, 10%, 25% I, resp. An unadultered sample of I, obtained by lab. extn. with petroleum ether, gave a different type of turbidity than that observed in presence of II. This turbidity, which might lead to false conclusions, was not observed if the soap soln. were filtered before dilg. with the 70% alc. Such filtration does not interfere with detection of II if actually present. J. W. Perry 4

Dielectric determination of the water content of oil seed (press) cake meals. H. Clever. *Fette u. Seifen* **46**, 676–8 (1939).—The heart of the instrument is a vertical glass cell with 2 pairs of condenser plates so arranged that the dielec. const. of the contents of the upper and lower parts of the cell can be detd. separately. In carrying out a moisture detn., the cell is filled with benzene and then enough sample, e. g., of an oil seed press cake, is added to 5 fill the lower part of the cell. Small increments of $PhNO_2$ are thoroughly mixed with the cell contents until the dielec. consts. of the upper and lower portions of the well-settled cell contents are equalized. At this point, the sample and the fluid in the cell have the same dielec. const. The moisture content of the sample is then established by consulting a curve obtained by plotting the dielec. const. of sample whose moisture content was detd. in some other way. J. W. Perry 6

Liver oils of some terrestrial animals. Mitumaru Tuzimoto and Hanzi Koyanagi. *J. Soc. Chem. Ind., Japan* **42**, Suppl. binding 421B-2(1939).—By extg. the minced livers with alc. and Et_2O the liver oil was sepd. from the combined ext. by soln. in Me_2CO. Yields of elephant, dog, rabbit and hen liver oils were, resp.: sample, 517, 970, 535, 1561 g.; liver oil, 5.8, 16.4, 11.2, 56.3 g. The dark brownish yellow oils had: d_4^{25} 0.9137, 0.9246, 0.9222, 0.9239 (d_4^{40}); n_D^{40}, 1.4695, 1.4730, 1.4660, 1.4700; acid value, 7.0, 4.5, 8.1, 2.3; sapon. value, 147.9, 152.7, 169.8, 167.8; Wijs I value, 146.0, 144.9, 109.3, 95.9; percentage of unsaponifiable matter, 21.13, 22.35, 14.81, 14.60; cod-liver oil value, 0, 39, 14, 50. Tests on the fat acids were: m. p., 48.5–49.5, 39–40, 40–41, 38–39; neutralization value, 189.9, 192.1, 198.6, 195.1; I value, 141.8, 139.7, 116.5, 90.3; Et_2O-insol. bromides, 33.5, 35.0, 16.0, 10.3; percentage of Br in the bromides, 65.59, 8 69.66, 68.50, 69.98. Cholesterol content of the unsaponifiable matter was (%): above 40, 56.5, 79.5 and 61.8. Palmitic, stearic and oleic acids were identified in the fat acids from hen liver oil and vitamin A was present in hen and dog liver oils. From the unsaponifiable matter of elephant, dog and hen liver oils, by satn. of the Et_2O soln. with HCl below 0°, hydrochlorides were obtained which melt about 129–130° and contain 29.70–30.15% Cl. The unsaponifiable matter of rabbit liver oil also yielded a trace of hydrochloride. George Ayers

Oleins. H. P. Kaufmann. *Olii minerali, grassi e saponi, colori e vernici* **20**, 4–8(1940)(in German and Italian).—A discussion of previous work. Cf. *C. A.* **33**, 6073[5,7,8]. J. W. Perry

Testing of waxes, particularly ozocerite. Edmund Graefe. *Petroleum Z.* **35**, 223–6(1939).—The m. p. is considered to be inadequate for the evaluation of wax. In order to obtain indication of the hardness of wax the type of penetrometer used in the asphalt industry has been adapted. Results therewith show that although a synthetic wax may have m. p. of 96° its penetration may be 32; such a wax would thus be much softer than, e. g., a montan wax with m. p. of 74° and penetration value 5. A list of 15 waxes, mainly synthetic ceresins, is presented; it includes: carnauba wax, m. 83°, penetration 1; ozocerite ceresine, 92° and 5; Borneo paraffin wax, 63° and 11. In detg. the m. p. of blends of waxes it is essential to use methods depending on latent heat, e. g., cooling curves. It has been found that the drop-point method may give results which are too high owing to the higher-m. p. constituents retaining the structure of an otherwise molten wax. B. C. P. A.

The characteristics, contaminants, processing and uses of beeswax. Geo. H. Vansell and C. S. Bisson. *U. S. Dept. Agr., Bur. Entomol. Plant Quarantine* E-495, 11 pp. (Feb., 1940).—Sixty samples of crude beeswax had acid no. 16.8–35.8, av. 19.2; I no. (Hanus) 6.8–16.4, av. 10.2; sapon. no. 89.3–149.0, av. 96.7; ash content 0.005–0.037, av. 0.019%; m. 143.6–149.0, av. 147.2°F.; solidifying point 141.3–146.3, av. 144.9°F.; d. at 68°F. 0.947–0.987, av. 0.961; *n* at 176°F. 1.4388–1.4527, av. 1.4407; color pale yellowish to white. The corresponding values for pure beeswax were 17.0, 5.8, 84.4, near zero, 147.9 ± 1, 146.3 ± 0.9, 0.963, 1.4402 and white. The av. acid no. of wax collected from scales was 17, whereas that for a sample of *propolis* was 125. Contamination of beeswax with propolis is very objectionable in the manuf. of cosmetics and ruins the wax for candle making, but is not objectionable when the wax is to be used for plant grafting, thread waxing and waterproofing. The gums and pitches which constitute propolis are not secreted by the bee, but originate from numerous plant sources, especially species of poplar in the western states. The relation between the pollen species and the color of beeswax is discussed. The color of beeswax is affected very adversely by contact with Fe during the rendering process, but Ni, Al, Monel metal, stainless steel and glass vessels have little or no effect. Galvanized Fe is satisfactory for solar extractors but is very objectionable for hot-water rendering. Partial clarification of the strained wax can be effected by boiling for at least 10 min. in 5% H_2SO_4. Oxalic acid can be substituted for H_2SO_4, but H_3PO_4 is not satisfactory. Acid treatment, followed by thorough washing, has little effect on the original acid no. of the wax, but the wax appears to be slightly harder and more brittle. The time required for bloom to form on beeswax ranged from 3 weeks to 3 months. The bloom melts at 102°F., more than 40° below the m. p. of the wax. The bloom is cryst.; its 7 nature and the cause of its formation are not well understood. Eight references. K. D. Jacob

Glycerin and its substitutes. F. Ohl. *Allgem. Oel- u. Fett-Ztg.* **36**, 245–50(1939).—A lecture. The possibilities of glycols, sugars, "perglycerin" (as a hygroscopic medium), ethanolamines, etc., as partial substitutes for glycerol are reviewed. B. C. P. A.

The use of standards in the control of soap-plant operations. W. A. Peterson. *Oil & Soap* **17**, 66–9(1940).—8 Standards can be used to control the following phases of plant operations: (1) the output of kettles, driers, evaporators, stills, etc.; (2) the loss of materials such as NaOH, NaCl, fats and glycerol during processing; (3) the quality of products; (4) the efficiencies of packing units such as presses, wrappers and filling machines; (5) the labor and controllable costs of unit operations; (6) the wastage of packing materials; and (7) the amt. of allowable scrap in bar soap cutting and pressing. A good standard 9 should be a measure of the normal performance under good operation. It must never be set so high that it is rarely attained, and should be based upon studies of each operation. E. Scherubel

Standard methods for sampling and analyzing soaps and soap products in the U. S. A. H. Fiedler. *Fette u. Seifen* **46**, 224–7, 355–9(1939). J. W. Perry

Soap solutions. Kurt Hess. *Fette u. Seifen* **46**, 572–5 (1939).—In further developing ideas (cf. *C. A.* **33**, 8471[7])

as to the structure of soap micelles, it is postulated that the micelles are built up of sheets of orientated soap mols. with –COONa groups forming one surface of the sheet and the terminal CH_3– groups of the parallel alkyl groups forming the other surface. In the micelles, the sheets are so arranged that pairs of –COONa surfaces face each other as do also pairs of CH_3– surfaces. On increasing the C chain length of the soap from C_4 to C_{10}, the amt. of water held between the –COONa surfaces of the adjacent sheets increases from 1 to 6 mols. per mol of soap. When clear dispersions of benzene are produced by addn. of limited amts. to a soap soln. contg. micelles, changes in the x-ray diagram showed that the benzene is taken up between the CH_3– surfaces of the sheets of soap mols. J. W. Perry

Determination of fat acids in soaps containing clay. Oskar Hagen. *Seifensieder-Ztg.* **67**, 72(1940).—A weighed sample (0.5 g. of 40% fat acids to 2.0 g. of high fat acid content) of soap is dissolved in hot water, transferred to a spherical separatory funnel (500–600 cc. capacity), acidified to methyl orange with 1:1 HCl, extd. with 75 cc. Et_2O, acid water is drawn off, any emulsion is broken so far as possible by use of 10% NaCl soln. Anhyd. Na_2SO_4 is added to combine with remaining water. The dried ethereal soln. is filtered, evapd. in a current of air and the ext. is weighed. A. Guillaudeu

Notes on the determination of phosphates in soap. L. B. Parsons and C. F. Haberstroh. *Oil & Soap* **17**, 62–4 (1940).—Complex phosphates as pyrophosphate and Na hexametaphosphate in soap are not completely pptd. with NH_4 molybdate when treated in the manner described by the present A. O. C. S. method for phosphate. Phosphates of this type are hydrolyzed to the ortho form when boiled steadily for 15 min. in a HNO_3 soln. Silicates interfere with the detn. by occluding phosphates if during dehydration they are heated at too high a temp. The vol. method for the detn. of phosphate is more rapid than the gravimetric method and yields results which are reliable and reproducible to within 1.5%. The method will det. total P_2O_5 but will not differentiate between the different types of phosphate; and is convenient where only one type is present. For mixts. of phosphates addnl. specific analyses must be used. E. Scherubel

Controlling naphthenic soap size. A. I. Gershzon. *Kozhevenno-Obuvnaya Prom.* **18**, No. 2, 40–1(1939); *Chimie & industrie* **42**, 874; cf. *C. A.* **33**, 8989[4,5].—The method is based on titration of the soap with a standard soln. at $Al_2(SO_4)_3$, with formation of a suspension of particles of Al naphthenate which is stabilized by the excess of naphthenic soap. The end of the reaction is marked by the fact that no further ppt. forms in the soln. at the points where the $Al_2(SO_4)_3$ drops strike it.
A. Papineau-Couture

Control of soap rancidity. Paul I. Smith. *Am. Perfumer* **40**, No. 3, 59–61(1940).—A review. E. H.

Making powdered soap with gas. Victor M. Alexieff. *Gas* **16**, No. 3, 17(1940).—A light, fluffy, powd. soap is made by spray-drying in a current of air mixed with products of combustion of gas at 255°F. Soap made in the usual way, but without addns. other than preservative to prevent rancidity, is conditioned at the desired temp. by the use of steam coils. It is then passed through a low-pressure pump, and then a high-pressure hydraulic pump to give a spraying pressure of 1000 to 3000 lb. per sq. in., then through a "saponifying valve" and finally through the spray nozzle having a 0.036-in. opening. The spray chamber is shaped very much like a centrifugal collector of cyclone type. The liquid soap is dried almost instantly, and is sucked by a fan into cooling and storing collectors. About 1.5 cu. ft. of natural gas was required per lb. of finished soap. R. W. Ryan

Soap perfuming in relation to the odor-carrying alcohol group. T. Ruemele. *Deut. Parfüm.-Ztg.* **25**, 141–2, 144 (1939).—A review of the source and properties of a no. of primary, *sec.*, and *tert.* perfumery alcs. and their use for soap perfumes. B. C. P. A.

Attachment for feeding hydrogen into the hydrogenation autoclave for fats. E. Ya. Vol'fson and I. A. Prokhorov. Russ. 55,897, Oct. 31, 1939. Construction details.

Apparatus for crushing soybeans in preparation for oil extraction. Henry Ford and Robert A. Boyer (to Ford Motor Co.). U. S. 2,186,066, Jan. 9. Various structural, mech. and operative details.

Apparatus for expressing oil-containing seeds. Max Duchscher. Brit. 508,909, July 7, 1939. The app. is provided with 2 swinging press containers, a swinging discharge carrier, a main pressing piston and an auxiliary piston.

Device for operating the cake-molding press in an oil-pressing installation. N. V. Oliefabrieken "Het Hart" en "De Zwaan" v. h. Adriaan Honig. Brit. 509,017, July 10, 1939.

Apparatus for acid treatment in delinting cottonseed, etc. Oscar L. Kettenbach (to Chemical Seed Treating and Delinting Corp.). U. S. 2,185,408, Jan. 2. Various details of app. with juxtaposed treating and washing drums, etc.

Polymerizing fatty oils. Anthony H. Gleason and Raphael Rosen (to Standard Oil Development Co.). U. S. 2,184,057, Dec. 26. A polymer of a semidrying fatty oil such as rapeseed oil suitable *for use in lubricating compns.* and which has a viscosity above 1000 sec. at 99°, is sol. in mineral oil, and has a substantially lower I No. than the original oil, is prepd. by dilg. the initial oil with a halogenated gaseous hydrocarbon such as ethylene dichloride, adding B fluoride to the oil and polymerizing at a temp. of about 25° for a prolonged period (suitably about 12 hrs. or longer) and stopping the reaction before the polymer becomes insol. (the B fluoride being passed through the mixt. while maintained at substantially room temp.).

Solid high-molecular alcohols from sperm oil. T. P. Egupov, A. A. Bag and S. V. Smirnov. Russ. 55,903, Oct. 31, 1939. Alcs. are prepd. from sperm oil by hydrogenation, sapon. with alc. alkali, and pptn. of the soaps with an alc. soln. of $CaCl_2$. The high-mol. alcs. are sepd. in the usual manner from the filtered soln.

Wax substitute. Ya. G. Sabun. Russ. 56,017 Nov. 30, 1939. Ca soap prepd. by treatment of fish oil with $Ca(OH)_2$ is distd. at 300–20°, and the distillate is hydrogenated.

Apparatus for making, removing and processing soap or the like. Benjamin H. Thurman (to Refining, Inc.). U. S. 2,185,653, Jan. 2. Various details are described of an app. comprising: a container, means for reducing the pressure in the container to form a low-pressure zone therein; means for continuously delivering a mixt. of soap particles to the low-pressure zone to evap. the volatile material and collect a mass of soap in the zone; an agitator in the low-pressure zone; means for moving the agitator through the soap particles in the low-pressure zone; conveyor means beneath the agitator for continuously withdrawing the soap particles from the low-pressure zone; and a star valve receiving the soap particles from the conveyor means for maintaining a sub-atm. pressure in the conveyor means.

28—SUGAR, STARCH AND GUMS

J. K. DALE

The keeping quality of sugars. H. D. Sen and J. P. Shukla. *J. Sci. Tech. India* 4, 43–52(1938).—The type of infection and the extent of deterioration of Indian white (sulfitation) sugars under the usual conditions of storage was studied. There seemed to be no effect on the keeping quality by either washing the sugar with alc. or storing in bags lined with corrocreppe paper or twill cloth. There was an enormous increase in bacterial count during the 3 month's storage. The av. loss of polarization between June and Sept. was 5.4 and the increase in reducing sugar was about 3.18%. J. C. Jurrjens

Beet milling. Fritz Teschner. *Deut. Zuckerind.* 65, 57–8(1940).—Better beet preservation methods and frequent change of milling disks improve beet milling. W. W. Binkley

Action of light-metal alloys on sugar juices. H. David. *Deut. Zuckerind.* 64, 98(1939).—Eight specified alloys of Al and two of Mg gave varying effects on the coloration of sugar juices. All gave evolution of H, Al or Mg passing into soln. and the alky. thereby increasing. B. C. P. A.

Unaccounted loss in beet-sugar manufacture. H. Claassen. *Deut. Zuckerind.* 64, 165–7, 187–8(1939).—See *C. A.* 34, 1506³. C. L. B.

Unaccounted loss in beet-sugar manufacture. J. Meyer. *Deut. Zuckerind.* 64, 227–8(1939).—While the solution of araban under Italian conditions of working would probably upset the balance (cf. preceding abstr.), the position with regard to German working is not clear. B. C. P. A.

Factory losses with different sugar content of the beets. E. Troje. *Deut. Zuckerind.* 65, 43–8(1940). W. W. B.

Simplification of the determination of harmful nitrogen in sugar beets. O. Unverdorben and G. Spielmeyer. *Bodenkunde u. Pflanzenernahr.* 16, 280–44(1940).—N compds. extd. in processing sugar beets interfere with recovery of sugar; their detn. is important to the refinery operator and beet breeder. Expts. with various modifications in procedure designed to reduce difficulties in Kjeldahl detn., including the use of H_2O_2 or $HClO_4$ as aids in digestion, are described. A source of error in this detn., for which no practical remedy has been found, is the presence of more or less nitrate in beet juices, causing low results for total N by reaction with amide N in the Kjeldahl digestion. It is proposed to det. N in the $Pb(OAc)_2$-purified juice after the regular polarization; expts. showed that the usually detd. "harmful N" averages very nearly 80% of the "$Pb(OAc)_2$-sol. N," so that the latter should serve equally as well for the index. It is pointed out that micro-Kjeldahl digestion using H_2O_2 and nesslerization instead of titration of NH_3 would make the detn. very rapid, and the information thus furnished should be as useful as that from the laborious technique now in use. Eleven references. C. J. Schollenberger

Micromethods for determining "injurious nitrogen." A. Janke, J. Holota and E. Mikschik. *Z. Wirtschaftsgruppe Zuckerind.* 89, 516–25(1939).—Two micromethods are described for the detn. of "injurious amino-nitrogen" in 0.1–0.3 cc. samples of sugar-beet juice. One method makes use of the Pulfrich photometer (Zeiss step-photometer), with microattachment, for the abs. colorimetry of the blue-colored solns. obtained when Cu sulfate and alkali are added to the clarified beet juice. The other method consists in a potentiometric formol-titration with a micro glass electrode. Results obtained with both methods show good agreement. The micro formol-titration method was used to det. the distribution of "injurious amino-nitrogen" within the sugar beet, and this was found progressively to decrease from the top to the tip, being particularly high in the former. Louis Pruess

Investigations on the fermentations appearing in diffusers with reuse of waste water, and their control. F. Reindel, A. Frey and B. Mändl. *Z. Wirtschaftsgruppe Zuckerind.* 89, 525–57(1939).—Reuse of diffuser run-off liquors and chip press-waters, as economy and stream pollution preventive measures, sometimes leads to a reduction in the output capacity of the diffusion battery. Signs of such a disturbance are gas formation in the diffusers, a decrease in the pH values of the liquors, and strong corrosion of pipes and pumps. These are brought about by the activity of microörganisms producing CO_2, H_2, acetic, butyric and lactic acids. Gas formation is greatest in the primary diffusers of the battery in which there is a low sugar concn. and favorable development temps. (60–65°). With increasing sugar concns. and absence of temp. optima the fermentation decreases. The main infection, as long as the waste liquors are outside of the diffusers, takes place in the chip pit, chip gutter and waste water storage reservoir. Two methods were studied for the suppression of the infectious fermentations: the use of disinfectants and heat sterilization. An hourly addn. of 2 kg. Cl (as Mg hypochlorites) per 100 cu. m. of waste liquor, or sterilization temps. of at least 85–90° were found effective. Louis Pruess

Investigations on the content of grit and dust-forming constituents in dried chips, Steffen chips and original sugar-beet chips. O. Spengler, K. Zablinsky and A. Wolf. *Z. Wirtschaftsgruppe Zuckerind.* 89, 503–12(1939).—The grit plus dust content, detd. by sieving, of dried chips (117 samples), Steffen chips (8 samples), and dried sugar-beet chips (59 samples), all used as *cattle feeds*, was found to be very low, in most cases less than 1%. In those samples contg. a high percentage of fine material it was shown that this consisted mainly of original beet substance (low ash content). Louis Pruess

Molasses yield and [beet-] juice purification. F. W. Meyer. *Deut. Zuckerind.* 64, 227(1939).—Modified methods of working, leading to better removal of non-sucrose and improvement in the phys. condition of the juice, have given improved yields of sucrose and diminished yields of molasses. B. C. P. A.

Yield of molasses from beets of different polarization and juices of different purity. H. Claassen. *Z. Wirtschaftsgruppe Zuckerind.* 89, 513–16(1939).—Two nomograms are presented showing the yield of molasses (48% polarization), as percentage of the sugar beet, which can be expected from beets with a polarization of 15–21% and thick juices with purities of 91–95. One diagram gives the molasses yields when the beets are worked up for crystal white sugar and the second diagram for crude sugar; both contain the data for molasses of 60 and 63 purity. L. P.

Conditions of precipitation of calcium saccharate from molasses after fermentation with noninverting yeast. H. D. Sen and N. R. Khanna. *J. Sci. Tech., India* 4, 53–8(1938); cf. *Proc. 6th Ann. Convention, Sugar Tech. Assoc., India* 1937, 359–69.—A study of the selective fermentation of molasses with 3 noninverting yeast types, *S. mali duclauxi* (I), *S. marxianus* and *S. citrus* showed that I was the most effective in decreasing the reducing sugar content. In 42 hrs. with a molasses of 45.7° Brix and an adjustment of pH at 6.4, the reducing sugar content was decreased from 27.10 to 5.07% (dry basis). The fermented sample was dild., cooled in an ice bath and 1/8 of the theoretical amt. of CaO added to ppt. the impurities such as gums and to remove color. The rest of the theoretical amt. of CaO was then added to ppt. sucrose as Ca saccharate (II). A sirup of 88.31% purity was obtained by decompn. of II with CO_2. Recovery of sucrose as II was more complete when pptn. was made from dil. soln. (17.5° Brix, 43.05% recovery; 10° Brix, 53.5% recovery). A. J. Stirton

The condition of starch solutions at extremely high shear velocities. W. Seck and G. Fischer. *Kolloid-Z.* 90, 51–8(1940).—The Hurrell colloid mill (*C. A.* 25, 2338) was used to obtain extremely high shear or displacement velocities and a theoretical discussion of its operation is given. Various root, seed and stem starches, namely potato, arrowroot, cassava, corn, wheat, rice and sago, were used in these expts. It is shown that mech. treat-

ment of all the starches resulted in greatly reduced viscosities (losses were up to 98% of the original viscosity). These high losses of viscosity can be correlated with the swelling properties of the various starches; the starch kernels showing the highest degree of swelling without disintegration suffer the greatest reduction in viscosity. The viscosity differences of the individual starches disappear to a large extent when the starches undergo mech. treatment. This viscometric equalization can be assumed to be due to the natural viscosity of the starch, uninfluenced by swelling phenomena. S. I. Aronovsky

Modified starches. III. Degradation of starches by acid and alkaline oxidizing agents, acids, etc. G. B. Jambuserwala and K. R. Kanitkar. *J. Textile Inst.* **31**, T1–16(1940).—Similar studies to those previously recorded (*C. A.* **33**, 9036[1]) on the degradation of starches are reported. The agents used were (*a*) mixts. of $K_2Cr_2O_7$ and H_2SO_4, with six concns. of the acid (ranging from 0.05 to 0.5 N), the quantity of $K_2Cr_2O_7$ being kept const. in all 6 cases (0.2%); (*b*) H_2SO_4 alone of the same concns. as in (*a*); (*c*) alk. hypochlorite solns.; (*d*) H_2SO_3; and (*e*) wetting agents, viz., Nekal BX and Igepon T. In addn. to the properties previously studied, the "binding values" of the modified starches were detd., and the chem. and textile qualities of these starches were compared with those of some of the com. "thin boiling" starches. Considering all the properties, farina starch is most affected by the treatments, followed by sago, wheat and corn in decreasing order of degradation. This is in agreement with earlier findings. The inherent tendency of raw starches to thin down on continuous boiling and stirring is eliminated on modification. The modified products in aq. soln. do not change in consistency on continued boiling and they give smooth homogeneous pastes in a much shorter cooking time. The present modified products compared favorably with raw and com. products as regards their textile qualities. They are considered more adaptable to textile operations than the raw varieties. Ruby K. Worner

Measurements of structure viscosity of various types of potato-starch products. H. Geinitz. *Kolloid-Z.* **90**, 58–65(1940).—The "Tsuda" viscometer (*C. A.* **23**, 10) was used for detg. the structure viscosity of dild. potato starch pastes. The starches were obtained from various types of com. potato flours. The effects of temp. and age of the pastes on the structure viscosity were measured. The viscosity decreased with increasing age of the paste, owing to purely chem. causes, mainly decompn. Increased temp. also lowered the viscosity. S. I. Aronovsky

Experiments on the preparation of starch and soluble starch. R. Kishore and K. C. Mukherji. *J. Sci. Tech., India* **4**, 27–32(1938). A. J. Stirton

Preliminary report on the chemistry of gum ghatti. Delbert Hanna, Leo McReynolds and Edwin H. Shaw, Jr. *Proc. S. Dakota Acad. Sci.* **19**, 130–2(1939); cf. *C. A.* **30**, 2456[1].—The H_2O-sol. portion of gum ghatti, after dialysis for 10 days against distd. water, evapn. on the water bath and final dehydration by boiling with CCl_4, had: pH of aq. soln. 5.5; P, none; N, 0.72%; ash, 1.9% (possibly Na and Ca compds.); and mol. wt. 2878 (from f.-p. depression) and 11,920 (from osmotic pressure). Dialysis of a soln. of gum ghatti in *N* H_2SO_4 and dehydration by boiling with CCl_4 gave a material which had: pH of aq. soln., 2.9; mol. wt. 1340–1735 per acid group; and galactose (AOAC method) 12%. The crude gum ghatti contained 26% of pentosans (AOAC method) and changed from *l*-rotatory to *d*-rotatory upon hydrolysis with H_2SO_4. The hydrolysis mixt. after treatment with $Ba(OH)_2$, concn. and drying, yielded a product (neutral to litmus) which was very sol. in water, and contained 33% Ba and 1.3% Cl and gave a weak reaction for reducing sugars (Benedict's reagent), a neg. resorcinol test for ketose, a pos. orcinol test for pentoses, galactose or uronic acid and galactosazone upon treatment with $PhNHNH_2$. The data seem to support the conclusion that gum ghatti is the tetra-Ca salt of an acidic polysaccharide of approx. 12,000 mol. wt., contg. galactose, uronic acid and pentose. George Ayers

29—LEATHER AND GLUE

MERRILL

Report on the work of the [Italian] Royal Experimental Station of the Leather and Tannins Industries. Vittorio Casaburi. *Boll. staz. sper. ind. pelli mat. concianti* **17**, 252–70(1939).—Among the data reported are results of expts. on the Italian tannins (both domestic and from the Colonies) in substitution of the quebracho wood and exts., and expts. on the leathers obtained; a new method of examg. sectioned leathers; studies on rabbit hair; the porosity of leather and the detn. of the true d. G. A. Bravo

Preparation of light skins for tannage. D. J. Lloyd. *Leather World* **31**, 247–9, 347–51(1939).—Free SH groups are present in the mols. of keratin in hair freshly plucked from a living animal, but they become oxidized after prolonged atm. exposure. The peptide linkings are protected from hydrolysis by such oxidation, which, however, can be reversed by the action of a reducing agent. The —SS— linkings prevent the alkali mols. from reaching the peptide chains. Sulfides, polysulfides, stannous salts, cyanides, and amines can reduce the oxidized keratin. Reduction with Na_2S is accompanied by such swelling and plumping that the necks of the hair follicles are closed and the hairs break off at the surface, leaving the hair roots in them. If possible, hairs should be loosened by weakening their roots. The mech. and phys. properties of leather depend on the condition of the fibers. The elastin network is weakened by bating. The reticular tissue must be weakened so that it will rupture under the swelling pressure of the collagen fibers; this can be brought about by soaking at pH 12.5 or by 5% aq. NaCl. The collagen fibers are not affected by the processes which affect the other proteins. B. C. P. A.

Introduction to the study of the chemical reactions of tannage. A. Deforge. *Halle aux cuirs* **1940**, 2–6.—As a preliminary to a study of the chemistry of tannage, D. discusses the various reactive groups of collagen, and the

types of chem. combination into which they may enter under different conditions. H. B. Merrill 1

Rapid control methods for the tanning industry. A. V. Vedeneteskil. *Koshevenno-Obuvnaya Prom.* **18**, No. 1, 38–9 (1939); *Chimie & industrie* **42**, 881.—Fat is detd. by extg. the sample with $CHCl_3$ in an extn. app., evapg. the solvent, and weighing. H_2O is detd by drying the defatted residue in a current of air, under reduced pressure. A. Papineau-Couture

Method of liming [calf] skins for chrome-tannage. H. Anderson. *J. Federation Curriers, Light Leather Tanners Dressers* **20**, 91–6, 115–20(1939).—The time of liming should be as short as possible and the skins very well swollen in order to produce a full feel and tight grain. The rate of swelling can be diminished by treating the skins with milk of lime before adding Na_2S, but this causes delayed depilation. Treatment with aq. $Ca(OH)_2$ (I) results in the formation of a stable S.Ca.S linking. The absorption of I by calf hair is greater than that of NaOH under similar conditions. The time of alk. treatment of the hair necessary to reduce the supercontraction on subsequent treatment with $NaHSO_3$ to zero is much greater with NaOH than with I. Bivalent metals form a link which is not formed by univalent metals. Addn. of a compd., e. g., NH_2Me, capable of reacting with the CHO formed by the loss of H_2S from the cystines in hair invariably prevents I from exerting its full protective effect on hair. Unhairing is not brought about by reduction in a pure I liquor. B. C. P. A. 2 3 4

Bates. A. Dohogne. *Bourse aux cuirs Belg.* **66**, 410–12, 511, 513, 515, 517, 519, 521, 523, 525(1938).—A review on the prepn., properties, activity and methods of use of fecal, mold, bacterial and enzymic bates for leather. Considerable attention is given to proprietary prepns. Methods of assay are described in some detail. References. W. C. Tobie 5

Porosity of leather. E. Salmoiraghi. *Boll. staz. sper. ind. pelli mat. concianti Napoli* **17**, 97–108(1939).—Detns. of the porosity by a modified Bergmann's app. (*C. A.* **22**, 1249) give results which are not strictly comparable. Leather is not a rigid substance and the sample disk used becomes curved under applied pressure. The size of capillaries does not remain const. II. *Ibid.* 175–87.—Satisfactory results were obtained by having the leather test-disks (diameters 49 and 35 mm.) enclosed between perforated metal disks. An applied pressure of 500 mm. H_2O is recommended and porosity expressed by the formula nr^4 (n = no. of pores, r = radius of average pore). B. C. P. A. 6

Analysis of leather split into sections. IV. Bohemian and Danish sole leather. C. Corradini. *Boll. staz. sper. ind. pelli mat. concianti Napoli* **17**, 139–48(1939); cf. *C. A.* **33**, 5696[6].—The author's method of sectional analysis has been applied to samples of Bohemian sole leather, one made by slow tannage and one by rapid, and to a rapid-tannage Danish sole leather, Normal values for degree of tannage were obtained. B. C. P. A. 7

Perspiration—its effects on the wearing qualities of shoes. Frederick L. Hilbert. *Shoe & Leather Reporter* **216**, No. 7, 27–9(1939).—The well-known destructive action of sweat on leather is laid to detannization by alk. decompn. products produced by bacteria. The remedy is to make the shoemaking materials bacteriostatic. H. B. Merrill 8

Protein fibers. W. Grassmann. *Atti X^mo congr. intern. chim.* **4**, 753–4(1939).—Most protein fibers have many structural modifications. Their mol. orientation can best be detd. by x-ray technique. Shrinkage of collagen fibers by heating with water can be measured by x-rays and by enzymic action. Crude fibers are not attacked by enzymes, while fibers that have been shrunk by exposure to heat are readily digested by enzymes. H ions favor shrinkage while OH ions have no effect. Tannins reduce shrinkage and strengthen the fibers. Heat treatment of collagen fibers in stretched condition prevents subsequent shrinkage. Chem. analysis of fibrous proteins point to chain linkages of amino acids with similar type amino acids recurring frequently. The amino acids of the collagen mol. stand to each other in a simple numerical ratio. D. Jorysch 9

Production of gelatin from bones defatted by organic solvents. D. I. Virnik and A. V. Zharkova. *Kino-Foto-Khim. Prom.* **1938**, No. 10, 42–6; *Khim. Referat. Zhur.* **1939**, No. 5, 123; cf. *C. A.* **33**, 2755[5].—For the prepn. of gelatin, bones were defatted by dichloroethane, benzene and water. The time required for maceration of bones defatted with org. solvents is 15–40% less than for bones defatted with water. A max. yield of gelatin was obtained from bones defatted with dichloroethane. The concn. of HCl during the maceration affected the following processes of the treatment of ossein as well as the yield of gelatin. Gelatin obtained from bones defatted with org. solvents was of higher quality. W. R. Henn 10

Treatment of furs (Vandenhaute) 25. Colloidal chem. properties of thermolyzed gelatin and potentio metric titration of products of its acid decompn. (Khenokh) 2. Artificial leather (Russ. pat. 55,986) 13.

Tanning compositions. Gustav Mauthe and Hermann Noerr (to I. G. Farbenind. A.-G.). U. S. 2,184,622, Dec. 26. A process for the manuf. of tanning substances by treating a lignin sulfonic compd. with an unsulfonated condensation product, being sol. or dispersible therein, of an aromatic hydroxy compd. and an agent known to be capable of linking aromatic nuclei, selected from the group consisting of org. compds., S, S halogen compds. and H_2SO_4, involves treating the lignin sulfonic compd. in the course of this manuf. with an alkali at elevated temp., whereby a substantial amt. of H_2SO_3 is split off from the lignin sulfonic compd. without forming insol. compds.

Leather-dyeing machines. Michael F. Flynn. Brit. 508,928, July 7, 1939.

Patent-leather finishes. Donald E. Edgar and Paul Robinson (to E. I. du Pont de Nemours & Co.). Can. 387,249, Mar. 5, 1940. Leather is treated with japanner's oil, and a top coating of the resinous reaction product of urea, formaldehyde and an aliphatic monohydric alc. is applied and baked. The resinous product contains 0.5–1.0 mol. alc./mol. of urea, and yields upon treatment with $ZnCl_2$ and Ac_2O the acetate of the alc. The leather product did not crack at −5°F.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

The rubber industry abroad fifty years ago. L. Thakar. *India Rubber World* **101**, No. 1, 67–72, 88(1939).—A review, with portraits of Macintosh, Hancock, Guibal and Pirelli. C. C. Davis

History of the Division of Rubber Chemistry of the American Chemical Society. E. V. Osberg. *India Rubber World* **101**, No. 1, 83–8(1939); *Rubber Chem. Tech.* **13**, 1–10(1940). C. C. Davis

Compounding in the nineteenth century. Webster Norris. *India Rubber World* **101**, No. 1, 60–2(1939).—Historical. C. C. Davis

Nineteenth century patent models relating to rubber. Kimball H. Stark. *India Rubber World* **101**, No. 1, 55–9 (1939).—Descriptive, with numerous illustrations. C. C. Davis

Abridged summary of reports of the Crude Rubber Committee of the Division of Rubber Chemistry of the American Chemical Society. Crude Rubber Committee (R. H. Gerke, E. B. Babcock, L. M. Freeman, G. A. Sackett and J. C. Walton). *Rubber Chem. Tech.* **12**, 638–45(1939).—The 7 progress reports of the Comm., only 3 of which have appeared in complete form and in different

publications (cf. *C. A.* **30**, 8679[2]; *Rubber Age* (N. Y.) **38**, 33(1935); *Rubber Chem. Tech.* **10**, xxvii(Oct., 1937)), are assembled as 7 individual condensed reports, embodying the features of lasting historical and tech. value in each report. Report III, not published heretofore, mentions a large amt. of exptl. work on *plasticity* by 6 methods, which shows that there is considerable variation in the plasticity of No. 1 smoked sheet, that different methods of detg. plasticity place rubber in different orders, and that mastication does not minimize these differences in plasticity. There seems to be no relation between the extent of smoking of sheet and plasticity nor between the extent of smoking and the rate of vulcanization. Report IV, not published heretofore, recommends new *methods for detg. Mn and Cu in crude rubber*. *Mn.*—Ash 10 g. rubber at the lowest practicable temp. (first over an open flame, then at dull red heat, finally in a muffle furnace for 1 hr., not necessarily to a white ash), fuse with 10–15 g. of $K_2S_2O_7$, heat at low red until all C particles are burned off, dissolve in 80–100 cc. of 5% H_2SO_4, add 5 cc. of 85% H_3PO_4, 15 cc. of H_2SO_4 (d. 1.84) and 20 cc. of HNO_3 (d. 1.42), filter through asbestos, wash with 10–15 cc. of HNO_3, heat the filtrate to 90–100 cc., add 0.2 g. of $NaIO_4$, keep at 90–100° for 5 min., and dil. to 250 cc. (soln. *A*). To 1 cc. of standard Mn soln. (from 0.406 g. of $MnSO_4.4H_2O$ in 1000 cc. of water) add 5 cc. of 85% H_3PO_4, 15 cc. of H_2SO_4 (d. 1.84) and 20 cc. of HNO_3 (d. 1.42), heat to 90–100°, add 0.2 g. of $NaIO_4$, heat for 5 min., and dil. to 100 cc. (soln. *B*). Place 25 cc. of *A* in a Nessler tube, place different vols. of *B* in other Nessler tubes, and dil. to the marks, until a soln. is found to match the color of the sample. % Mn = [(cc. of *B*)(g. of Mn per cc.)(10)/(wt. of sample)] × 100. *Cu.*—Ash 20 g. of sample as for Mn, add 5 cc. of concd. HCl, heat to boiling, dil., boil for a few min., cool, make alk. with NH_4OH, conc. to 15 cc. on a steam plate, add several drops of Br water (unnecessary if the rubber contains less than 0.001% Mn), heat to boiling, filter through a Gooch crucible into a graduated tube, dil. to 30 cc., place 10 cc. in a 50-cc. Nessler tube (if the percentage of Cu is high (0.01%) use 5 cc.; if very low, use 20 cc.), and add 22.5 cc. of 95% pure EtOH and 2.5 cc. of a 1% soln. of Na diethyldithiocarbamate in 95% pure EtOH (soln. *A*). The standard soln. (*B*) should contain 0.00001 g. of Cu per cc. (prepd. from $CuSO_4$ in 5% aq. NH_4OH and standardized by electrolysis, with Pt electrodes). Prep. a soln. like the sample, using 10 cc. of water in place of the portion of the sample and add standard soln. until the colors are alike. % Cu = [(cc. of *B*)(g. of Cu per cc.)(3)/(wt. of sample)] × 100. Expts. failed to confirm reports of other investigators that light smoked sheet tends to be harder and more difficult to masticate than dark smoked sheet. Both had practically the same plasticity and rate of vulcanization. Coöperative work by the London Advisory Comm. for Rubber Research has led to tentative standards for raw rubber. Two mixts. have been adopted, and in each case limits are recommended for the properties of rubber vulcanized in this way. Mixt. *A* (rubber 100, S 10) should give a "good technical cure" within the limits of 70 and 100 min. at 148°, and the tensile strength should be at least 130 kg. per sq. cm. Mixt. *B* (rubber 100, S 3.5, mercaptobenzothiazole 0.5, stearic acid 0.5, ZnO 6) should give a "good technical cure" within the limits of 30 and 60 min. at 125°; the tensile strength should be at least 130 kg. per sq. cm. and the stress at 700% elongation should be within the limits of 60 and 130 kg. per sq. cm. A desirable improvement of this modulus requirement to obtain rubber of greater uniformity and medium rate of vulcanization would be limits of 85 to 120 kg. per sq. cm. The plasticity of mixt. *B* is detd. by maintaining a piece 1 cm. high and 1 cm. in diam. at 95° for 30 min., applying a load of 600 g. for 30 sec., and measuring the recovery in height 30 sec. after the load is removed; this recovery should not be more than 30% of the vertical deformation under the load at the end of 30 sec. The adaptability of mixt. *B* for detg. the plasticity of crude rubber is questionable. C. C. Davis

Variability of plantation latex. Surface tension. D. S. Villars. *Ind. Eng. Chem.* **32**, 368–72(1940).—An investigation of some of the factors which affect the surface tension of latex shows that the system of tapping, part of tapping month, soil, differences between trees, fertilizing and temp. at which the latex is aged have, from a practical point of view, no significant influence on the surface tension of latex contg. 1.25% of NH_4OH. From a statistical point of view, very significant seasonal effects were found, but they were not sufficiently well defined to distinguish them from consistent errors in technique which vary from time to time. The surface tension of freshly ammoniated latex was found always to decrease with aging. C. C. Davis

Investigation of synthetic and plant latexes by microscopic and ultramicroscopic methods. K. Mikhallova and M. Bass. *Sbornik Trudov Opytnogo Zavoda im. S. V. Lebedeva* **1938**, 53–74; *Khim. Referat. Zhur.* **2**, No. 5, 66 (1939).—The particles of 1 sample of plant latex (I), 3 samples of bivinyl latex (II) and 6 samples of chloroprene latex (III) were measured microscopically and ultramicroscopically. Photomicrographs of the latexes were taken and the diams. of the microparticles were measured according to the method of Green. The mean diams. of the microparticles were: I 0.988 μ, II 0.64 μ and III 0.66 μ. The mean diams. of the ultramicroparticles were: I 0.139 μ, II 0.118 μ and III 0.085 μ. The mean diams. of all particles were: I 0.3018 μ, II 0.119 μ and III 0.086 μ. The nos. of particles ($\times 10^{-10}$) in 1 g. of a 35% latex were: I 2589, II 50008, III 95045. The nos. of microparticles ($\times 10^{-10}$) in 1 g. of a 35% latex were: I 66.8, II 1.9 and III 4.1. The wt. fractions of rubber in a 35% latex attributed to the larger particles were: I 90.5, II 0.76 and III 1.92. The degree of dispersion of synthetic latexes was considerably greater than that of plant latexes, and chloroprene latex was less uniform than bivinyl latex (min. diam. of the particles and a larger no. of the coarser particles). Small amts. of Na oleate caused no visible changes either in bivinyl or in the chloroprene latexes. Borax caseinate increased considerably the size of the microparticles (the wt. of one sample increased from 1.02 to 19.81%), except in bivinyl latexes. No changes were observed in the plant latexes during storage, whereas in synthetic latexes the no. of the larger particles increased at the expense of an arbitrary increase of the size of the submicroscopic particles. W. R. Henn

The preparation of preserved latex and of concentrated latex. Anon. (Algem. Proefsta. A. V. R. O. S.). *Vlugschr.* No. **39**(in Dutch), 5–24, 40–56; in English, 25–39) (1939).—A crit. review and discussion, with data and diagrams, of the several processes for concg. latex which are, or have been, of com. importance, including the important features of the patents. Storage, packing and shipping problems also are considered. C. C. Davis

The viscosity of preserved and concentrated latex. I. Relation between dry rubber content and viscosity. Edgar Rhodes and H. Fairfield Smith. *J. Rubber Research Inst. Malaya* **9**, 171–88(1939).—A revision of the paper by Rhodes, *et al.*, *C. A.* **33**, 3203[4]. The best-fitting regressions are changed in the revision to: $\log \eta = 0.055 + 0.938 \tan p$ for preserved field latex; and $\eta = -228.4 + 4.525\ p$ for centrifugal concentrates where p is the dry rubber content in percentage. The latter equation holds only in the region $\tan p = 1.5$ to 1.9. C. L. B.

Distribution of flock size in the creaming of Hevea latex. E. M. McColm. *India Rubber World* **101**, No. 3, 38–42 (1940).—The concn. gradient in *Hevea* latex, which becomes visible during the process of creaming, induced by artificial creaming agents was utilized to est. flock-size distribution by a modification of ordinary sedimentation methods. The results obtained with any particular latex with 2 different creaming agents which act differently are attributed to a difference in the distribution of flock size which results. If under given exptl. conditions a creaming agent yields a cream contg. more rubber than that in a cream obtained by another creaming agent, then the former creaming agent causes a wider distribution of flock size, which in turn results ultimately in tighter packing. This concept would still hold true if a state of semithixo-

tropy were to be established during the creaming process. C. C. Davis

Hevea latex sludge. Existence of a sludge fraction in fresh unpreserved latex. E. M. McColm. *Ind. Eng. Chem.* **32**, 439–40(1940).—Although latex sludge, which consists largely of $MgNH_4PO_4.6H_2O$, has long been a problem on the plantations, it has not been generally recognized that a sludge can be sepd. from latex fresh from the tree. Newly tapped latex was dild. immediately and passed through a Sharples supercentrifuge, all latex was removed from the sludge by centrifuging the latter repeatedly, and the sludge was treated in 3 ways: (1) dried at 100°, giving a slightly elastic, slightly cohesive, oily product; (2) dried at room temp. *in vacuo* over H_2SO_4, giving a bad-smelling product, probably from bacterial or enzyme action; and (3) washed with acetone and dried *in vacuo* over H_2SO_4. Analyses of the products by (1) and (3) gave in percentages: dry sludge in undild. latex 0.11; dry sludge in latex total solids 0.27; acetone ext. of dry sludge 29.5; rubber in dry sludge 36.0; N in extd residue (based on dry sludge) 3.44; N in ext. (based on dry sludge) 0.63; ash in extd. residue (based on dry sludge) 1.5; ash in ext. (based on dry sludge) 2.5. The acetone ext. (20.6% was in the acetone washings of the wet sludge) was oily and had an acid no. of 7.25, i. e., equiv. to 36.13% free acid (as stearic acid). The remaining 8.9% of acetone ext. was removed slowly, was a yellow, waxy semisolid, its acid no. was 4.8, and it resembled the lipide of Rhodes and Bishop (*C. A.* **25**, 3512). *Hevea* lipide gave an acid no. of 2.3, whereas R. and B. reported 14. The sludge from new latex, when still wet, can be dispersed rapidly in dil. NH_4OH or other alkalies; the suspension is permanent and only by prolonged centrifuging can even traces of sediment be sepd. The residue from the acetone and $CHCl_3$ extns. is slightly dispersible in dil. NH_4OH, although sufficiently so to give a strong biuret test for protein. C. C. Davis

Antipercussion latex films. P. Mabb. *Rubber Age* (N. Y.) **46**, 229–31(1940).—See *C. A.* **33**, 9711[9]. C. C. Davis

Measurement of the mechanical properties of natural rubber and of synthetic rubber. W. Philippoff. *Kautschuk* **15**, 191–4(1939).—A crit. discussion of the physics of deformation, with particular reference to plasticity and its methods of measurement. C. C. Davis

The development of basic rubber-processing machinery. S. C. Stillwagon. *India Rubber World* **101**, No. 1, 50–4, 62(1939).—Illustrated. C. C. Davis

A mechanical oscillograph for routine tests of rubber and rubber-like materials. Felix L. Yerzley. *Rubber Chem. Tech.* **13**, 149–58(1940).—See *C. A.* **33**, 6645[7]. C. C. Davis

Influence of the nature of solvent on the properties of fractions of natural rubber. B. M. Kovarskaya and S. M. Lipatov. *Colloid J.* (U. S. S. R.) **5**, 767–79(1939); cf. *C. A.* **34**, 923[7].—Solns. of pale crepe rubber in Et_2O and in C_6H_6 were pptd. by EtOH in steps, and the 6 fractions were dissolved in various solvents. The viscosity of these solns. showed a behavior inconsistent with the theory of Staudinger (cf. *C. A.* **32**, 3236[9]). (1) Two of the 6 fractions gave viscosities not proportional to the concn. (2) The fractions from Et_2O had lower viscosities than those from C_6H_6; this shows that the solvent affected the properties of the rubber. (3) The apparent mol. wt. of a fraction depended on the solvent used for measurements of η. (4) The ratio of the viscosities of 2 fractions depended on the solvent. (5) The η value of a mixt. of 2 fractions was not equal to the sum of the single viscosities; this indicates an adsorption of smaller mols. by larger micelles. J. J. Bikerman

Buna rubbers. Albert Koch. *Ind. Eng. Chem.* **32**, 464–7(1940).—The characteristics, processing and practical applications of Buna-85 (I), Buna-S (II), Perbunan (Buna-N) (III) and Perbunan Extra (IV) are described in more detail than in previous papers (*C. A.* **30**, 8680[9], 8681[1]; **31**, 2859[8]) and further information is added, particularly about III. Essentially I is a relatively low-mol. polymer of $H_2C{:}CHCH{:}CH_2$ (V); II is a mixed polymer of V and $PhCH{:}CH_2$; III is a mixed polymer of V and $H_2C{:}CHCN$ (VI); IV is the same as III but with a higher proportion of VI. Although IV has the same general properties as III, it is characterized by greater resistance to solvents, oils, etc. Unlike II (cf. Hagen, *C. A.* **33**, 897[8], 7146[7]), III and IV cannot be plasticized by hot air but only by mastication and addn. of softening agents. The compounding and processing of III are discussed. In general, S, org. accelerators, C black, etc., have the same effects on III as on natural rubber. C. C. Davis

Refractometer studies of rubber-pigment mixtures. H. C. Jones. *Ind. Eng. Chem.*, **32**, 331–4(1940).—A refractometric examn. of mixts. of rubber and ZnO showed that the n value increases when ZnO is milled into rubber and that the magnitude of this change is a function of the particle size of the ZnO and of the proportion added to the rubber. This effect was proved to depend on mastication (cf. McPherson and Cummings, *C. A.* **29**, 5395[6]), for the n value does not increase until the dried latex-ZnO film is milled. When ZnO is dissolved out of a rubber-ZnO mixt., the n value decreases to approx. that of the rubber to which no ZnO has been added. Addn. of pptd. $CaCO_3$ to rubber increases the n value of the latter, but to a less degree than does ZnO. Other pigments increase the n value still less. The opacity of some pigments and the large particle size of others prevent satisfactory examn. by transmitted light. C. C. Davis

The colloidal structure of rubber in solution. Colloidal aspects of vulcanization. S. D. Gehman and J. E. Field. *Ind. Eng. Chem.* **32**, 282–7(1940).—Colloidal changes which take place in solns. of purified rubber under the influence of a vulcanizing system composed of S, piperidinium pentamethylenedithiocarbamate and Zn propionate were followed by measuring changes in viscosity, and in depolarization and intensity of transversely scattered light. A study of the time required to vulcanize C_6H_6 solns. of rubber by the combined agents mentioned above showed that temp. coeff. of vulcanization is approx. the same value as that of the same mixt. vulcanized in the dry state. The light-scattering measurements indicate that the addn. of vulcanizing agents to rubber solns. increases the size of the colloidal units. The coincident decrease in viscosity is attributed to a diminution in the "interlocking" of the units. An equil. between the various colloidal processes is reached during vulcanization of such solns., and when this equil. is attained, the viscosity becomes const. during the greater part of the subsequent vulcanization. On the contrary, light-scattering changes continuously throughout vulcanization, and the magnitude of this continuous change indicates that the clusters of mols. in the gelled soln. probably do not differ very much from those in the original soln. However, viscosity measurements indicate that the forces between these clusters have been strengthened greatly. C. C. Davis

Questions of priority in the kinetic theory and thermodynamics of rubber-type elasticity. A correction of the work of K. H. Meyer. Edgar Wöhlisch. *Helv. Chim. Acta* **22**, 1358–62(1939).—See *C. A.* **34**, 905[4]. S. R. K.

The packaging of smoked sheets for plantation shipment. Don E. Andrews. *India Rubber World* **101**, No. 6, 33–7(1940).—The method used on the U. S. Rubber Co. estates is described and illustrated. C. C. Davis

The resistance of rubber to dynamic forces. I. R. Ariano. *Gomma* **3**, 97–103(1939); *Rubber Chem. Tech.* **13**, 81–91(1940).—The work of deformation by impact forces acting on a rubber-S (100-8) vulcanizate and on a vulcanizate of the solid tire type was detd. It is proved that the work expended in reaching a given elongation is greater by application of a dynamic force than a static force. The difference in the 2 values increases with increase in elongation for a given velocity of impact and increases with the velocity at impact for a given elongation. Estimates of the elongation at rupture by an impact force lead to the conclusion that, at least for vulcanized rubber contg. no fillers, this elongation is less than that reached with a slowly increasing stress. C. C. Davis

Characterization of the plastic-elastic state. E. Rohde. *Kautschuk* **15**, 64–8; *Rubber Chem. Tech.* **12**, 799–804 (1939).—When stressed repeatedly, vulcanizates prepd.

publications (cf. *C. A.* **30**, 8679[7]; *Rubber Age* (N. Y.) **38**, 33(1935); *Rubber Chem. Tech.* **10**, xxvii(Oct., 1937)), are assembled as 7 individual condensed reports, embodying the features of lasting historical and tech. value in each report. Report III, not published heretofore, mentions a large amt. of exptl. work on *plasticity* by 6 methods, which shows that there is considerable variation in the plasticity of No. 1 smoked sheet, that different methods of detg. plasticity place rubber in different orders, and that mastication does not minimize these differences in plasticity. There seems to be no relation between the extent of smoking of sheet and plasticity nor between the extent of smoking and the rate of vulcanization. Report IV, not published heretofore, recommends new *methods for detg. Mn and Cu in crude rubber*. *Mn.*—Ash 10 g. rubber at the lowest practicable temp. (first over an open flame, then at dull red heat, finally in a muffle furnace for 1 hr., not necessarily to a white ash), fuse with 10–15 g. of $K_2S_2O_7$, heat at low red until all C particles are burned off, dissolve in 80–100 cc. of 5% H_2SO_4, add 5 cc. of 85% H_3PO_4, 15 cc. of H_2SO_4 (d. 1.84) and 20 cc. of HNO_3 (d. 1.42), filter through asbestos, wash with 10–15 cc. of HNO_3, heat the filtrate to 90–100 cc., add 0.2 g. of $NaIO_4$, keep at 90–100° for 5 min., and dil. to 250 cc. (soln. *A*). To 1 cc. of standard Mn soln. (from 0.406 g. of $MnSO_4.4H_2O$ in 1000 cc. of water) add 5 cc. of 85% H_3PO_4, 15 cc. of H_2SO_4 (d. 1.84) and 20 cc. of HNO_3 (d. 1.42), heat to 90–100°, add 0.2 g. of $NaIO_4$, heat for 5 min., and dil. to 100 cc. (soln. *B*). Place 25 cc. of *A* in a Nessler tube, place different vols. of *B* in other Nessler tubes, and dil. to the marks, until a soln. is found to match the color of the sample. % Mn = [(cc. of *B*)(g. of Mn per cc.)(10)/(wt. of sample)] × 100 *Cu.*—Ash 20 g. of sample as for Mn, add 5 cc. of concd. HCl, heat to boiling, dil., boil for a few min., cool, make alk. with NH_4OH, conc. to 15 cc. on a steam plate, add several drops of Br water (unnecessary if the rubber contains less than 0.001% Mn), heat to boiling, filter through a Gooch crucible into a graduated tube, dil. to 30 cc., place 10 cc. in a 50-cc. Nessler tube (if the percentage of Cu is high (0.01%) use 5 cc.; if very low, use 20 cc.), and add 22.5 cc. of 95% pure EtOH and 2.5 cc. of a 1% soln. of Na diethyldithiocarbamate in 95% pure EtOH (soln. *A*). The standard soln. (*B*) should contain 0.00001 g. of Cu per cc. (prepd. from $CuSO_4$ in 5% aq. NH_4OH and standardized by electrolysis, with Pt electrodes). Prep. a soln. like the sample, using 10 cc. of water in place of the portion of the sample and add standard soln. until the colors are alike. % Cu = [(cc. of *B*)(g. of Cu per cc.)(3)/(wt. of sample)] × 100. Expts. failed to confirm reports of other investigators that light smoked sheet tends to be harder and more difficult to masticate than dark smoked sheet. Both had practically the same plasticity and rate of vulcanization. Coöperative work by the London Advisory Comm. for Rubber Research has led to tentative standards for raw rubber. Two mixts. have been adopted, and in each case limits are recommended for the properties of rubber vulcanized in this way. Mixt. *A* (rubber 100, S 10) should give a "good technical cure" within the limits of 70 and 100 min. at 148°, and the tensile strength should be at least 130 kg. per sq. cm. Mixt. *B* (rubber 100, S 3.5, mercaptobenzothiazole 0.5, stearic acid 0.5, ZnO 6) should give a "good technical cure" within the limits of 30 and 60 min. at 125°; the tensile strength should be at least 130 kg. per sq. cm. and the stress at 700% elongation should be within the limits of 60 and 130 kg. per sq. cm. A desirable improvement of this modulus requirement to obtain rubber of greater uniformity and medium rate of vulcanization would be limits of 85 to 120 kg. per sq. cm. The plasticity of mixt. *B* is detd. by maintaining a piece 1 cm. high and 1 cm. in diam. at 95° for 30 min., applying a load of 600 g. for 30 sec., and measuring the recovery in height 30 sec. after the load is removed; this recovery should not be more than 30% of the vertical deformation under the load at the end of 30 sec. The adaptability of mixt. *B* for detg. the plasticity of crude rubber is questionable. C. C. Davis

Variability of plantation latex. Surface tension. D. S. Villars. *Ind. Eng. Chem.* **32**, 368–72(1940).—An investigation of some of the factors which affect the surface tension of latex shows that the system of tapping, part of tapping month, soil, differences between trees, fertilizing and temp. at which the latex is aged have, from a practical point of view, no significant influence on the surface tension of latex contg. 1.25% of NH_4OH. From a statistical point of view, very significant seasonal effects were found, but they were not sufficiently well defined to distinguish them from consistent errors in technique which vary from time to time. The surface tension of freshly ammoniated latex was found always to decrease with aging. C. C. Davis

Investigation of synthetic and plant latexes by microscopic and ultramicroscopic methods. K. Mikhailova and M. Bass. *Sbornik Trudov Opytnogo Zavoda im. S. V. Lebedeva* **1938**, 53–74; *Khim. Referat. Zhur.* **2**, No. 5, 66 (1939).—The particles of 1 sample of plant latex (I), 3 samples of bivinyl latex (II) and 6 samples of chloroprene latex (III) were measured microscopically and ultramicroscopically. Photomicrographs of the latexes were taken and the diams. of the microparticles were measured according to the method of Green. The mean diams. of the microparticles were: I 0.988 μ, II 0.64 μ and III 0.66 μ. The mean diams. of the ultramicroparticles were: I 0.139 μ, II 0.118 μ and III 0.085 μ. The mean diams. of all particles were: I 0.3018 μ, II 0.119 μ and III 0.086 μ. The nos. of particles ($\times 10^{-10}$) in 1 g. of a 35% latex were: I 2589, II 50008, III 95045. The nos. of microparticles ($\times 10^{-10}$) in 1 g. of a 35% latex were: I 66.8, II 1.9 and III 4.1. The wt. fractions of rubber in a 35% latex attributed to the larger particles were: I 90.5, II 0.76 and III 1.92. The degree of dispersion of synthetic latexes was considerably greater than that of plant latexes, and chloroprene latex was less uniform than bivinyl latex (min. diam. of the particles and a larger no. of the coarser particles). Small amts. of Na oleate caused no visible changes either in bivinyl or in the chloroprene latexes. Borax caseinate increased considerably the size of the microparticles (the wt. of one sample increased from 1.02 to 19.81%), except in bivinyl latexes. No changes were observed in the plant latexes during storage, whereas in synthetic latexes the no. of the larger particles increased at the expense of an arbitrary increase of the size of the submicroscopic particles. The preparation of preserved latex and of concentrated latex. Anon. (Algem. Proefsta. A. V. R. O. S.). *Vlugschr.* No. **39**(in Dutch, 5–24, 40–56; in English, 25–39) (1939).—A crit. review and discussion, with data and diagrams, of the several processes for concg. latex which are, or have been, of com. importance, including the important features of the patents. Storage, packing and shipping problems also are considered. C. C. Davis

The viscosity of preserved and concentrated latex. I. Relation between dry rubber content and viscosity. Edgar Rhodes and H. Fairfield Smith. *J. Rubber Research Inst. Malaya* **9**, 171–88(1939).—A revision of the paper by Rhodes, *et al.*, *C. A.* **33**, 3203[4]. The best-fitting regressions are changed in the revision to: $\log \eta = 0.055 + 0.938 \tan p$ for preserved field latex; and $\eta = -228.4 + 4.525\ p$ for centrifugal concentrates where p is the dry rubber content in percentage. The latter equation holds only in the region $\tan p = 1.5$ to 1.9. C. L. B.
